| Module Code | EEMT17 |
| Module Name | SPATIAL AUDIO |
| ECTS Weighting¹ | 5 ECTS |
| Semester taught | Semester 2 |
| Module Coordinator/s | DR ENDA BATES |
| Module Learning Outcomes with reference to the Graduate Attributes and how they are developed in discipline | <p>On successful completion of this module, students should be able to:</p> <p>LO1. Compose, produce and design original spatial content for fixed and interactive media, live performance, and interactive installations</p> <p>LO2. Produce and engineer spatial recordings using binaural and surround microphone techniques, and setup and configure spatial audio software and hardware</p> <p>LO3. Characterise the strengths and weaknesses of different spatialization methods, and understand the psychoacoustic principles underlying different approaches to spatial audio</p> <p>LO4. Analyse, describe and identify techniques and methods used by spatial music composers, sound designers, and acousticians.</p> <p>Graduate Attributes: levels of attainment</p> <p>To act responsibly - Attained</p> <p>To think independently - Attained</p> <p>To develop continuously - Attained</p> <p>To communicate effectively - Attained</p> |
| Module Content | <p>Spatial Audio is a one-semester module which is intended for those interested in using spatial audio techniques in a variety of different contexts, including but not limited to; spatial music, cinema surround sound, VR and 360 Video, multimedia performance and interactive installations, audio production and recording, surround sound for gaming and mobile devices, sonification, auditory interfaces, and psychoacoustics.</p> <p>This course is intended to enable future audio engineers, composers, researchers and sound-designers to clearly determine the optimal spatialization schemes and techniques for a given application and environment, as well as motivating further innovation and artistic creativity in the field. Students are presented with a wide variety of spatial content, both in class and also in additional listening sessions/concerts of contemporary and historical works of spatial electroacoustic music. The history of spatial audio is discussed, in terms of mainstream cinema</p> |

¹ [TEP Glossary](#)

and film, popular music releases, 360 Video, and a wide variety of contemporary/ electroacoustic music and composers. Students are encouraged to critically assess the strengths and weaknesses of different techniques to enable their effective and creative use of spatial audio in different contexts.

The aim of this module is to give the student a complete understanding of all relevant aspects of current spatial audio technology. It addresses the psychoacoustic principles underlying different techniques, as well as practical production techniques for binaural processing, 5.1 and 7.1 surround sound using the DAW Reaper, Ambisonics, Dolby Atmos, and a variety of spatial microphone techniques. By the end of the course, the student will have a deep understanding of the issues and creative possibilities of spatial audio and a thorough knowledge of all relevant spatial audio systems and topics. This knowledge will enable students to effectively use spatial audio in their subsequent artistic work, and/or facilitate further technical research in this area.

Teaching and Learning Methods

The teaching strategy is a combination of lectures, software and hardware tutorials, dedicated listening sessions, and critique classes on assignment work. Tutorials in Reaper and spatial audio plugins are held throughout the semester, along with practical demonstrations of recording techniques and microphones, and acoustic analysis. Dedicated listening sessions/concerts of classic and contemporary works of spatial music are presented throughout the module. In addition, conventional lecture presentations include many demonstrations of other material, in particular surround sound for film and popular music releases in 5.1 and 7.1 Surround Sound. The initial assignment focuses on binaural audio processing and the capture of spatial impulse responses. The second, larger assignment consists of a number of options, a surround recording of a music ensemble, band, orchestra or choir, a studio-based spatial music composition, or an acoustical analysis of captured spatial room impulse responses. These options reflect the wide variety of potential applications of spatial audio, and the potentially quite different interests of students taking this module.

Assessment Details²

Please include the following:

- **Assessment Component**
- **Assessment description**
- **Learning Outcome(s) addressed**
- **% of total**
- **Assessment due date**

| Assessment Component | Assessment Description | LO Addressed | % of total | Week due |
|----------------------|--|--------------|------------|----------|
| Assignment 1 | <p>Binaural Plugin Comparison Tests (MMT Students) Object: Compare the perceptual performance of two different binaural plugins</p> <p>Binaural Room Impulse Response (BRIR) Survey (MAI/MSc students) Object: Create and Analysis a number of Binaural Room Impulse Responses using ReaVerb</p> | 1,2,3 | 25% | Week 6 |
| In class exam | MCQ exam via Blackboard on various topics covered in the module classes to date. | 3, 4 | 10% | Week 8 |
| Assignment 3 | <p>Option A: 5.1 Location Music Recording (MMT Students) Object: Produce a location music recording for 5.1 using various multichannel microphone techniques.</p> <p>Option B: Spatial Music Composition (MMT Students) Object: Compose an original work of spatial music for 7.1 using Higher Order Ambisonics, B-format recordings, Stereophony and Parameter Modulation in Reaper.</p> <p>Option C: Acoustics Survey and FOA IR capture (MAI Students) Object: Perform an on location acoustic survey</p> | 1,2,3,4 | 65% | Week 13 |
