MRI Brain image performed at time of representation with seizure at 3 months

MRI – frontal lobe lesion

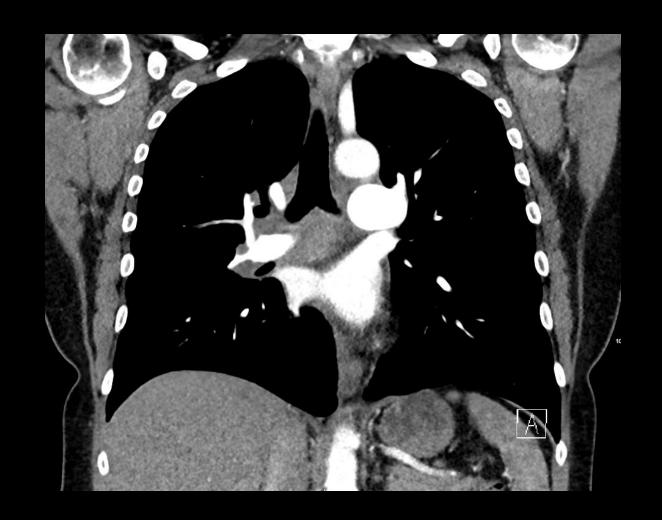

Endobronchial lesion visualized during work-up at time of representation 2 months into TB treatment course with paradoxical reaction.

Significant mediastinal adenopathy noted on CT Thorax with endobronchial extension on direct visualization.

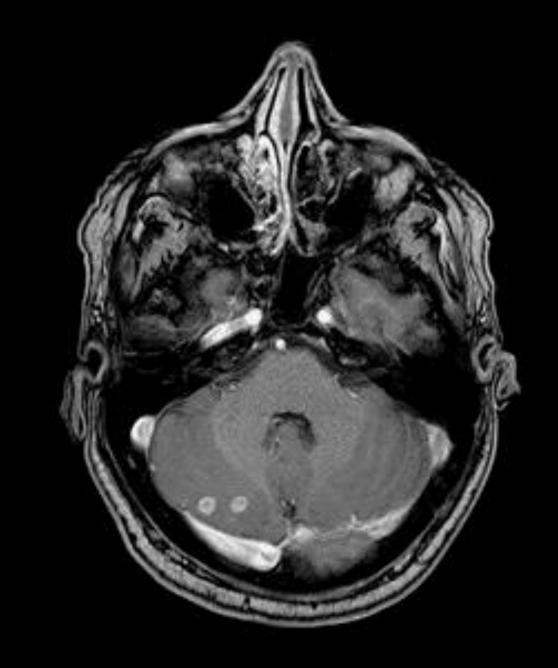

CT Thorax demonstrating increased subcarinal adenopathy PR at ATS station 7.

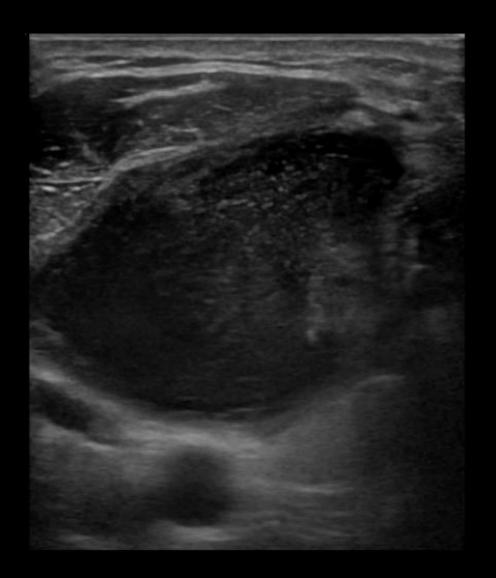

Bronchoscopy image demonstrating endobronchial involvement PR of the left lower lobe on direct visualization.

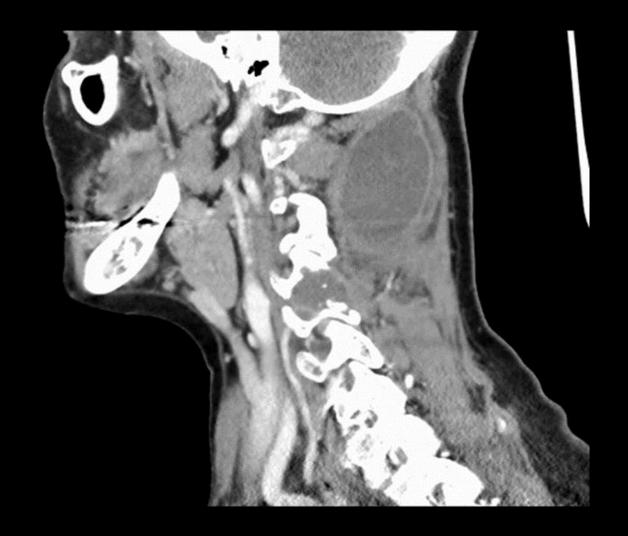

MRI Brain revealing multiple intracranial lesions consistent with CNS PR

Ultrasound image revealing right sided supraclavicular adenopathy PR.

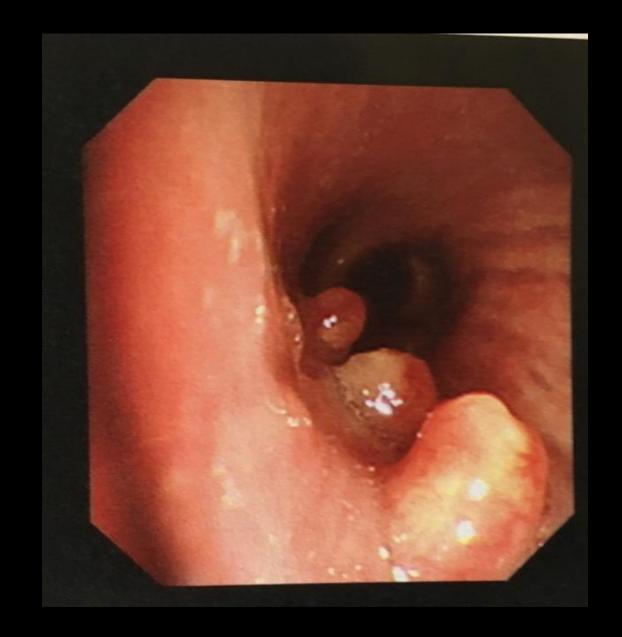

Significant occipital adenopathy PR noted on CT Neck.

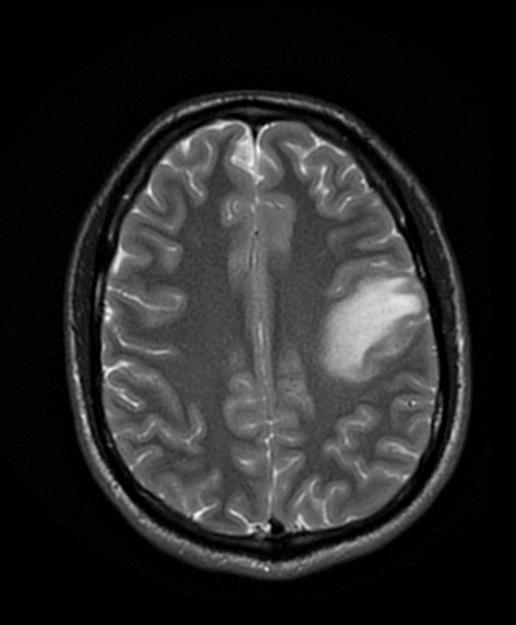

MRI Brain demonstrating multiple PR foci in left frontoparietal lobe and cerebellum.

Airway endobronchial PR right lower lobe

MRI Brain revealing 11 mm enhancing PR lesion in the left frontal lobe.

MRI Brain demonstrating right sided cerebral abscess with meningitis PR.
