Introduction

Physics lies at the heart of most of science and technology. For example, modern biology seeks to analyse many of the processes of life in terms of physical laws. The search for a fundamental understanding and the drive towards technological development in areas such as computer hardware continue to pose fresh challenges to physicists. They are tackled with a combination of experiment, theory and computation. Our degree courses combine all three of these elements and prepares the student for a wide range of careers with combinations of transferable skills unique to our degrees. Our graduates are thus in demand for positions in research both here and overseas, and for a very wide range of jobs in industry and commerce.

A note on this handbook

This handbook applies to Sophister students in the TR063 Physical Sciences course reading Physics, Physics and Astrophysics or Nanoscience and all students in TR035 Theoretical Physics (TP). It provides a guide to what is expected of you from the School of Physics in these programmes and the academic and personal support available to you. Any Junior and Senior Fresh students taking Physics in TR060 Biological and Biomedical Sciences, TR061 Chemical Sciences, TR062 Geosciences, or TR063 Physical Sciences should consult the relevant Handbook for their courses, which are available at <http://www.tcd.ie/Science>.

Junior Sophister students in TR063 Physical Sciences reading Physics, Physics and Astrophysics or Nanoscience should also consult the relevant Sophister Programme Handbook for their course, which is available at [Junior Sophister - Science | Trinity College Dublin \(tcd.ie\)](#).

Please note that this handbook only provides information regarding courses, modules, exams etc. within the School of Physics. Students following courses provided jointly with other Schools should also consult relevant information sources in those Schools and in the Science Course Office and their course handbooks.

The information provided in this handbook is accurate at time of preparation. Any necessary revisions or changes will be notified to students via email. Please note that, in the event of any conflict or inconsistency between the General Regulations published in the University Calendar and information contained in this handbook, the provisions of the General Regulations in the

University Calendar will prevail, excepting where the General Regulations defer to the School or Programme Handbook.

General School Information

History

The School of Physics has a distinguished history of teaching and research stretching back over 300 years to Richard Helsham, the first Erasmus Smith's Professor of Natural and Experimental Philosophy (1724), who was the first to lay out Newton's methods in a form suitable for the undergraduate in his book *Lectures in Natural Philosophy*, which was in use for a hundred years in the College and elsewhere in Europe. Later holders of the chair include G. F. Fitzgerald, famous in relativity theory, and E. T. S. Walton, the first Irish recipient of a Nobel Prize in a science subject, in Physics in 1951, for his part in the 1932 transmutation of lithium into two alpha particles. In 2024 a series of events celebrating the Tercentenary or 300-year history of physics in Trinity College Dublin were held. See <https://www.tcd.ie/physics/300/>

Facilities

An elegant, dedicated Physical Laboratory building was completed in 1906, now named the Fitzgerald building, and with the Sami Nasr Institute for Advanced Materials (SNIAM), which was completed in 2000, these house the central part of the School today. The School, which is based in these buildings and in CRANN, provides excellent modern facilities for teaching and research for a very lively community of over 200 physicists, technical and support staff, including 30 academic staff, approximately 60 postdoctoral fellows and 125 graduate students.

Research

In research, the School has a worldwide reputation, and several staff members are recognised as leaders in their fields. Much of this research is funded by Science Foundation Ireland and/or the European Research Council. Inventions and technical developments arising from our research have led to the foundation of several spin-off companies in recent years. Physics is the School with the largest participation in the Centre for Research in Nanoscience and Nanodevices (CRANN), which is located in the Naughton Institute and has excellent research facilities including a state-of-the-art suite of electron and ion microscopes in the Advanced Microscopy Laboratory (AML). Many staff members and research students in the School of Physics carry out research in CRANN. The School is also a major participant in Research IT which

is the Trinity centre for high performance computing, which is housed in the adjacent Lloyd building, named for Bartholomew Lloyd and his son, Humphrey, who both worked in Trinity in the 19th century and made important contributions in mathematics, mathematical physics, optics and the study of terrestrial magnetism. The School also has programmes of cooperation with both the School of Cosmic Physics, Dublin Institute for Advanced Studies (DIAS) and with Armagh Observatory.

Programme Overview

The School of Physics offers four Moderatorship (honours degree) courses in which Physics is a main component. In addition, students in Junior Fresh (first year) reading TR060 Biological & Biomedical Sciences, TR061 Chemical Sciences or TR062 Geography & Geoscience may choose to take the Physics modules offered for their course of study as do Engineering students.

The four Moderatorships are outlined with relevant CAO course code and the full course name.

Physics Moderatorship TR063 - Physical Sciences

Physics is a central moderatorship in the School of Physics. Students follow the TR063 Physical Sciences course in their Junior and Senior Fresh years and in both years must take the prescribed Core modules in Physics (20 credits each year) and Mathematics (20 credits and 15 credits). Building on the courses taken in the first two years, students follow in-depth courses (theory, experiment and computational) across the spectrum of modern physics. There is a particular emphasis on condensed-matter physics, i.e., the physics of solids, reflecting the School's research strength in this area. Students who wish to proceed to a degree in Physics must take the prescribed modules in both first and second years in Physics (20 credits each year) and Mathematics (20 credits and then 15 credits, respectively) as well as the History, Ethics and Philosophy of Science (5 credits) in the second year. In the Junior and Senior Sophister (third and fourth) years students take a variety of specialist Physics modules. In Junior Sophister year students take a Trinity Elective module (5 credits). In Senior Sophister year students work on a capstone research project (20 credits) in one of the research groups in the School, CRANN or at another institution.

Course Outcomes for Physics

On successful completion of this course, students should be able to:

- a) Demonstrate in written and oral form a comprehensive level of knowledge of physics and of the mathematics that underpins this knowledge, together with an awareness of its place within the broader science curriculum
- b) Apply the core concepts of Classical and Modern Physics across a wide spectrum of topics and applications, such as information technology and materials science
- c) Perform calculations to solve practical problems, including the use of numerical methods and computing

- d) Operate sophisticated spectrometers and similar test and evaluation apparatus, across a wide spectrum of investigation
- e) Independently design and carry out an experiment and evaluate critically the data obtained, including appropriate error analysis
- f) Communicate the results of an experiment or project via dissertation, poster and oral presentation
- g) Employ literature search methods to obtain information relevant to research and development
- h) Act effectively as an individual or as a member of a team in professional, educational and industrial settings
- i) Update personal knowledge with a high degree of autonomy, whether in the workplace or in the context of further study

Physics and Astrophysics Moderatorship TR063 – Physical Sciences

Students follow the TR063 Physical Sciences course in their Junior and Senior Fresh years and must take the prescribed modules in both first and second years in Physics (20 credits each year) and Mathematics (20 credits and then 15 credits, respectively) as well as the History, Ethics and Philosophy of Science (5 credits) in the second year. The Physics course in these first two years includes introductory Astrophysics lectures. In the Junior and Senior Sophister (third and fourth) years students take a variety of specialist astrophysics and computational modules as well as core Physics modules. In the Senior Sophister year, students work on a capstone research project (20 credits) either in Astrophysics or Physics. Projects in either Astrophysics or Physics take place in one of the Astrophysics or Physics research groups in the School, the School of Cosmic Physics, Dublin Institute for Advanced Studies (DIAS), Armagh Observatory or at another institution/observatory.

Course Outcomes for Physics and Astrophysics

On successful completion of this course, students should be able to:

- a) Demonstrate in written and oral form a comprehensive level of knowledge of physics and astrophysics and the mathematics that underpins this knowledge, together with an awareness of its place within the broader science curriculum
- b) Apply the core concepts of Classical and Modern Physics across a wide spectrum of topics and applications, such as information technology and materials science
- c) Perform calculations to solve practical problems, including the use of numerical methods and computing
- d) Perform advanced numerical calculations using appropriate program design and execution
- e) Independently design and carry out an experiment and evaluate critically the data obtained, including appropriate error analysis
- f) Communicate the results of an experiment or project via dissertation, poster and oral presentation

- g) Employ literature search methods to obtain information relevant to research and development
- h) Act effectively as an individual or as a member of a team in professional, educational and industrial settings
- i) Update personal knowledge with a high degree of autonomy, whether in the workplace or in the context of further study

Theoretical Physics Moderatorship TR035 – Theoretical Physics

This course is taught jointly by the Schools of Mathematics and Physics. In the first year (Junior Fresh), students take prescribed Physics modules (20 credits) and Mathematics modules (40 credits). In the second year (Senior Fresh), students take prescribed Physics modules (20 credits) and Mathematics modules (20 credits), one 5 credit Trinity Elective in each semester, and choose the remaining 10 credits from among Mathematics and Statistics Open Modules. In the Junior and Senior Sophister (third and fourth) years of the Theoretical Physics course, students may opt to study more Physics or Mathematics modules, depending upon the options available and with certain required module selections. In the Senior Sophister (fourth) year students will do an extended capstone project (20 credits) in either the School of Physics or the School of Mathematics. Students should consult relevant information sources in the School of Mathematics for details of modules, requirements etc. in Mathematics.

Course Outcomes for Theoretical Physics

On successful completion of this course, students should be able to:

- a) Tackle a wide range of topics using powerful analytical tools, including formal methods in classical and quantum physics
- b) Clearly communicate information and conclusions in written and verbal formats on core ideas in Theoretical Physics
- c) Evaluate complex problems and formulate solutions, identifying the role of theory, hypothesis and experiment in the scientific method
- d) Apply computers to the solution of problems in theoretical physics
- e) Plan, carry out and report a theoretical-physics-based investigation
- f) Apply classical and quantum theoretical techniques in research
- g) Work independently in a research environment and as part of a research team
- h) Undertake professional work in physics at a high level

Nanoscience TR063 – Physical Sciences - entry also via TR061 – Chemical Sciences

The Nanoscience degree (formerly known as Nanoscience Physics and Chemistry of Advanced Materials, which was a four-year direct entry course) is taught jointly by the Schools of Physics and Chemistry. Students follow the TR063 Physical Sciences course in their Junior and Senior

Fresh years and must take the prescribed modules in both first and second years in Physics (20 credits each year), Chemistry (20 credits in each year) and Mathematics (20 credits and then 15 credits, respectively) as well as the History, Ethics and Philosophy of Science (5 credits) in the second year. Specialized lectures and tutorial classes, introducing students to the study of materials are included. In the Junior and Senior Sophister (third and fourth) years, students study core topics in Physics and Chemistry along with some specialized modules in Nanoscience and Advanced Materials. Junior Sophister students take a Nanoscience and Advanced Materials laboratory classes including an introduction to experimental techniques for Nanoscience that is carried out in the research laboratories in CRANN, when conditions allow it. In the Senior Sophister year students work on a capstone research project (20 credits). In many cases, when conditions allow, students travel abroad to conduct research in an academic or industrial research laboratory. Students should consult relevant information sources in the School of Chemistry for details of modules, requirements etc. in Chemistry.

Course Outcomes for Nanoscience

On successful completion of this course, students should be able to:

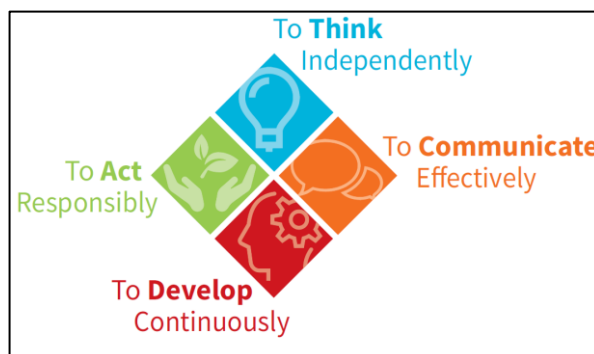

- a) Articulate in written and oral form a foundation level of knowledge and understanding of Physics, Chemistry and Mathematics
- b) Apply key concepts in Physics and Chemistry and key concepts in the Physics and Chemistry of Materials for the design of materials with novel properties
- c) Design, perform, and analyse the results obtained from experiments in materials physics and chemistry using modern physical and chemical experimental methodologies and instrumentation, with particular reference to materials
- d) Demonstrate skills in problem-solving, critical thinking and analytical reasoning, and be able to effectively communicate the results of their work to chemists, physicists, material scientists and others, both verbally and in writing
- e) Use modern library searching and retrieval methods to obtain information pertinent to the identification and solution of problems in the physics and chemistry of materials, and the exploration of new research areas
- f) Work effectively and safely in a laboratory environment operating within the proper procedures and regulations for safe handling and use of chemicals and instruments
- g) Design and perform appropriate experiments to address materials physics and chemistry problems, and analyse the results
- h) Update their knowledge and undertake further study with a high degree of autonomy.

Graduate Attributes

The Trinity Graduate Attributes represent the qualities, skills and behaviours that you will have the opportunity to develop as a Trinity student over your entire university experience, in other words, not only in the classroom, but also through engagement in co- and extra-curricular activities (such as summer work placements, internships, or volunteering).

The four Trinity Graduate Attributes are:

- To Think Independently
- To Act Responsibly
- To Develop Continuously
- To Communicate Effectively

Why are the Graduate Attributes important?

The Trinity Graduate Attributes will enhance your personal, professional and intellectual development. They will also help to prepare you for lifelong learning and for the challenges of living and working in an increasingly complex and changing world.

The Graduate Attributes will enhance your employability. Whilst your degree remains fundamental, also being able to demonstrate these Graduate Attributes will help you to differentiate yourself as they encapsulate the kinds of transversal skills and abilities, which employers are looking for.

How will I develop these Graduate Attributes?

Many of the Graduate Attributes are 'slow learned', in other words, you will develop them over the four or five years of your programme of study.

They are embedded in the curriculum and in assessments, for example, through undertaking independent research for your final year project, giving presentations and engaging in group work.

You will also develop them through the co-curricular and extra-curricular activities. If you help to run a club or society you will be improving your leadership skills, or if you play a sport you are building your communication and team-work skills.

Programme Regulations (including Progression Regulations)

Assessment and examination procedures

All students take modules totalling 60 credits in each year, made up of 30 credits in each Semester. Each module must be passed for a student to be deemed to have passed the year. The pass mark is 40%. Overall marks and grades are calculated according to a weighted average based on the number of credits for each module, and there is also provision for 'qualified pass' of modules as described in the Calendar Part II Undergraduate Studies Part B1 'General Regulations and Information'. In the Fresher years there is a derogation from the General Regulations, whereby a minimum threshold for examination or laboratory performance is required. This will supersede the 'qualified pass' regulation described above. A detailed discussion of this is in the section on Progression below.

The final degree mark in each Moderatorship is calculated using a weighted combination of the JS and SS year marks, using the formulae described for each degree course in the Calendar Part II Undergraduate Studies Part C6 'Faculty of Science, Technology, Engineering and Mathematics'.

Modules in Physics are assessed by end-of-semester examination and by continuous assessment where indicated in the *Index of Modules* (see end of this handbook). Modules (e.g. laboratory, project, communication skills, seminars) may have 100% continuous assessment.

Students who have failed a module, are reassessed in the failed components of a module. In addition, those Fresher students who have not achieved the minimum threshold in the designated examination or laboratory components, have a 'qualified fail' and are reassessed in those components.

Scholarships, Prizes and Awards

Fitzgerald Medal and prize in Theoretical Physics – A FitzGerald medal will be awarded annually on the recommendation of the Head of the School of Physics to a candidate who obtains a first-class moderatorship in the Theoretical Physics degree and who has shown outstanding merit. In exceptional circumstances a second medal may be awarded.

Tercentenary of Physics in Trinity Medal and prize in Physics – A Tercentenary of Physics in Trinity (1724 – 2024) medal will be awarded annually on the recommendation of the Head of the School of Physics to the candidate who obtains a first-class moderatorship in Physical Sciences – Physics and who has shown outstanding merit. In exceptional circumstances a second medal may be awarded.

Tercentenary of Physics in Trinity Medal and prize in Physics and Astrophysics – A Tercentenary of Physics in Trinity (1724 – 2024) medal will be awarded annually on the recommendation of the Head of the School of Physics to the candidate who obtains a first-class moderatorship in Physical Sciences – Physics and Astrophysics and who has shown outstanding merit. In exceptional circumstances a second medal may be awarded.

Walton Prize in Physics – awarded annually, on the nomination of the Head of the School of Physics, to the student who gives the most meritorious performance in the Junior Fresh physics course (20 credits).

Minchin Prize – awarded annually to two students who have performed with particular merit in the work of the previous Junior Sophister year in mathematics and/or physics.

Henderson-Lloyd Prize – awarded to the student who has obtained the highest marks in the moderatorship examination in Nanoscience. The prize is awarded on the recommendation of the Director of Nanoscience

McGilp Project Prize in Physics – awarded to the student who has obtained the highest mark for the Senior Sophister project work in the Physics, or Physics and Astrophysics, moderatorship. The prize is awarded on the recommendation of the Head of the School of Physics

European Credit Transfer System (ECTS)

The ECTS is an **academic credit transfer and accumulation system** representing the student workload required to achieve the specified objectives of a study programme. The ECTS weighting for a module is a **measure of the student input or workload** required for that module, based on factors such as the number of contact hours, the number and length of written or verbally presented assessment exercises, class preparation and private study time, laboratory classes, examinations, clinical attendance, professional training placements, and so on, as appropriate. There is no intrinsic relationship between the credit value of a module and its level of difficulty.

In Trinity College Dublin, **1 ECTS credit is defined as 20-25 hours** of student input, so a 10-credit module will be designed to require 200-250 hours of student input, including class contact time and assessments. The norm for **full-time** study over one academic year at **undergraduate level** is 60 credits. **ECTS credits are awarded to a student only upon successful completion of the course year.** Progression from one year to the next is determined by the course regulations. Students who fail a year of their course will not obtain credit for that year even if they have passed certain component modules. Exceptions to this rule are one-year and part-year visiting students, who are awarded credit for individual modules that are completed successfully.

Progression and Awards

An overview of the progression regulations within the Physics programme are detailed here. The School of Physics has specific derogations from the undergraduate progression and awards regulations within the degree programmes accredited by the Institute of Physics (IoP), the Physics, Physics and Astrophysics, Nanoscience and Theoretical Physics degrees.

Information on the general regulations for undergraduate progression and awards can be found via the following webpage:

<https://www.tcd.ie/teaching-learning/academic-affairs/ug-prog-award-regs/index.php>

Information in relation to all undergraduate Regulations can be found via the following:
<https://www.tcd.ie/teaching-learning/academic-affairs/ug-regulations/>

Derogation from progression regulations applying to accredited Physics programmes

The full text of these School of Physics derogations from the progression and award regulations can be found at: <https://www.tcd.ie/teaching-learning/academic-affairs/ug-prog-award-regs/derogations/by-school.php>. Select the year and scroll to the School of Physics.

A detailed exposition of these are here.

A) Minimum mark requirement and Qualified Fails in Fresher years

- i. These regulations apply to the Fresher JF and SF 10 credit modules that are core to Physical Sciences (TR063) and Theoretical Physics (TR035), and which are available as Open modules to JF and SF Chemical Sciences (TR031) students.

These modules are JF: PYU11P10, PYU11T10, PYU11P20, PYU11T20; and in SF: PYU22P10, PYU22T10, PYU22P20, PYU22T20. (This does not include PYU11F10, PYU11F20, PYU11H20).

- ii. In these Fresher modules there is a minimum mark requirement of 30% separately in both the Examination component and the Laboratory component, in order for either a Pass or a Qualified Pass mark in the module to be granted. The Progression threshold is not simply an overall module mark of 40% or higher, but requires minimum marks in these components.
- iii. A mark of less than 30% in either the Examination or Laboratory components leads to a Qualified Fail. A Qualified Fail requires reassessment in that component before progression to the next year can occur. Reassessment of the exam component is in the reassessment examination period; reassessment of the laboratory component occurs before the beginning of the reassessment examination period.
- iv. If a mark of less than 30% occurs or recurs in the examination or laboratory component following the reassessment period, the student cannot progress and must repeat the year. This necessarily applies to students who had deferred their first attempt at examinations to the reassessment period.
- v. Students who fail a module with a module mark of $<40\%$, but $\geq 35\%$ are not eligible for Pass by Compensation, or a Qualified Pass, if either of the examination or laboratory components is less than 30%.
- vi. For context only, two points are repeated from the general undergraduate progression and awards regulations. The first is that as much as 10 credits can be eligible for a Qualified Pass or a pass by compensation with marks of 35% or higher, provided the other 50 credits

of module marks are 40% or higher, and there is an overall pass. Secondly, students who fail a given module can only be reassessed in failed components of the module.

B) Capping of reassessed components in reassessment session in Fresher and Sophister years

In reassessments, a cap (maximum mark) of 60% will apply to

- i. All the reassessed components for core Junior Fresh and Senior Fresh Physics modules delivered as part of the Physical Sciences and Theoretical Physics courses (and available to students in the Chemical Sciences course as Open modules) which are listed above in A(i).
- ii. All reassessed components of all modules in the Sophister years (except Trinity Electives) within the four accredited degree programmes Physics, Physics & Astrophysics, Nanoscience, and Theoretical Physics, irrespective of the owning School. Accreditation of these degree programmes is by the Institute of Physics (IoP).

The abovementioned capping will apply to re-assessed components of the affected School of Physics (PYU code) modules irrespective of the degree stream of the student, registration or visiting student status, or year of first admission. The Sophister PYU modules are not available to any other non-accredited Sophister degree programmes.

Re-assessment capping does not apply to deferred 1st attempts at assessment.

Rationale for capping reassessments in Physics degrees

The capped reassessments are required of College and the School of Physics by the Institute of Physics (IoP) for continued accreditation of our four degree programmes in Physics, Physics with Astrophysics, Nanoscience and Theoretical Physics. This is to ensure the continued integrity and quality of our degree programme, results and outcomes. It should be noted that uncapped resits are not the norm in other universities either in Ireland or elsewhere that have degrees accredited by the IoP, where the usual capping level of reassessed components or exams is at 40%. The reassessment capping level agreed with the IoP is a compromise between ensuring the continued quality of our degree recipients and their degree results against the intended purpose and rationale underpinning uncapped resits elsewhere in College. That policy was to encourage students to achieve the intended learning outcomes in the reassessment by engaging fully with learning in order to do their best, and this is still possible as students are rewarded for doing more than the minimum required to pass.

Examples in Junior Fresh or Senior Fresh of Qualified Fails:

Example of a qualified fail at the first attempt:

- Student A in their Semester 1 JF module obtains a mark of 60% in their labs, 80% in their assignments but 25% in their examination with weightings of 30%, 10% and 60% respectively. Their module mark is thus $(60 \times 0.3) + (80 \times 0.1) + (25 \times 0.6) = 18 + 8 + 15 = 41\%$. This however is a Qualified Fail as they obtained a mark $< 30\%$ in their examination. They do not pass the module and must present for reassessment.

- Student B in their Semester 2 JF module obtains a mark of 60% in their labs, 80% in their assignments but 20% in their examination with weightings of 30%, 10% and 60% respectively. Their module mark is thus $(60 \times 0.3) + (80 \times 0.1) + (20 \times 0.6) = 18 + 8 + 12 = 38\%$. This is a Fail mark in the module, and this mark is not eligible to be a Qualified Pass as this student obtained a mark $< 30\%$ in their examination. They do not pass the module and must present for reassessment. Compensation rules otherwise apply to module marks $\geq 35\%$ provided 50 credits of modules have achieved a pass mark and no more than 10 credits of module are equal to or above 35% and none are below 35%, provided that the annual average mark is 40% or higher.

Example of a qualified fail at the second attempt:

- If either Student A or Student B above obtained those marks in their reassessment examination at their second attempt, i.e. obtaining a Qualified Fail or being ineligible for a Qualified Pass, they must repeat the year. Instead of a full repeat year on-books there is the possibility to apply through their Tutor to take the following year as an Off-Books student taking Assessment in this module, if they are eligible to do so.

Example of a capped reassessment:

- Student C in their Semester 2 SF module obtains a mark of 50% in their labs, 80% in their assignments but 20% in their examination with weightings of 30%, 10% and 60% respectively. Their module mark is thus $(50 \times 0.3) + (80 \times 0.1) + (20 \times 0.6) = 15 + 8 + 12 = 35\%$. This is a Fail and they are reassessed in the failed component, and not eligible for compensation or a Qualified Pass as they had a mark $< 30\%$ in their examination. In their reassessed exam, having engaged at length with the material they perform well in their examination and would obtain a mark of 80%. This exam mark component is capped at 60% while the other component marks remain as they were.
- The final mark is thus calculated as: $(50 \times 0.3) + (80 \times 0.1) + (60 \times 0.6) = 15 + 8 + 36 = 59\%$ for the module.

Attendance requirement of the School of Physics:

All students must attend College in person during the teaching term. They must take part fully in the academic work of their class throughout the period of their course. This is understood to mean attendance at all lecture and tutorials. The requirements for attendance at lectures and tutorials in the School of Physics is thus a matter for the student.

Attendance at laboratories in the School of Physics is compulsory for students in all years. Permission to be absent must be sought at least one week in advance. Permission for absence in retrospect can be granted e.g. for medical or family reasons, on a case-by-case basis, and submission of the appropriate absence from College form, and informing the laboratory supervisor as soon as possible.

Non-satisfactory attendance:

Non-attendance of 50% of laboratories or greater, which is otherwise unexplained by illness, exigent circumstances or by permission sought in advance, can result in a student being deemed non-satisfactory in their attendance.

Such non-satisfactory attendance falls under section §24 and §25 of the University Calendar Part II Undergraduate Studies Part B1 'General Regulations and Information'.

Students whose attendance is reported as non-satisfactory may be required by the Senior Lecturer to repeat the year. This request will be made by the School of Physics in January, in advance of the commencement of Hilary term (for cases of non-satisfactory attendance in Michaelmas term) or two weeks prior to the publication of annual examination results (for cases of non-satisfactory attendance in Hilary term).

The relevant Calendar regulations are replicated here.

Calendar Part II regulations on Attendance, Non-Satisfactory Attendance and Exceptions

Attendance §17 – 19

17 All students must begin attendance at the College not later than the first day of teaching term, unless they have previously obtained permission from the Senior Lecturer through their tutor.

18 All Students must attend College in person during the teaching term. They must take part fully in the academic work of their class throughout the period of their course. Lecture timetables are published through my.tcd.ie and/or elsewhere, as appropriate, before the beginning of Michaelmas teaching term. The onus lies on students to inform themselves of the dates, times and venues of their lectures and other forms of teaching by consulting these timetables.

19 The requirements for attendance at lectures and tutorials vary between the different faculties, schools and departments. The school, department or course office, whichever is relevant, publishes its requirements for attendance at lectures and tutorials in handbooks, and/or elsewhere, as appropriate. () Attendance at lectures and practical classes is compulsory for students in all years of () any programme where it is indicated as a requirement in handbooks or elsewhere.

() indicates text irrelevant to this handbook or programme being omitted.

Non-satisfactory attendance §24 – 25

24 All students must fulfil the programme and/or module requirements of the school, department or programme, as appropriate, with regard to attendance.

25 At the end of the teaching term, students who have not satisfied the school, department or programme requirements, as set out in Calendar §§19 and 24 [and described in the School of

Physics handbook] above, may be reported as non-satisfactory in their attendance for that term. The Procedures for completing a report on Non-Satisfactory Attendance (NSA) should be followed. These can be accessed on the College website at www.tcd.ie/academicregistry/studentcases, where a copy of the NSA form can also be found.

Students whose attendance is reported as non-satisfactory may be required by the Senior Lecturer to repeat their year. If this consequence is requested by a School, a fully completed non-satisfactory attendance (NSA) form must be received by the Senior Lecturer via Student Cases no later than two working weeks prior to the commencement of Hilary term (for cases of non-satisfactory attendance in Michaelmas term) or two weeks prior to the publication of annual examination results (for cases of non-satisfactory attendance in Hilary term).

Concerning special circumstance exemptions, and/or disability or illness §20 – 23

20. In special circumstances exemption from attendance at lectures for one or more terms may be granted by the Senior Lecturer; application for such exemption must be made in advance through the tutor. Students granted exemption from attendance at lectures are liable for the same annual fee as they would pay if attending lectures. Students thus exempted must perform such exercises as the Senior Lecturer may require. If these exercises are specially provided, an additional fee is usually charged.

21 Students who in any term have been unable, through illness or other unavoidable cause, to attend the prescribed lectures satisfactorily, as determined by the relevant School, department or programme, may be granted credit for the term by the Senior Lecturer and must perform such supplementary exercises as the Senior Lecturer may require. Such requests will be only considered in extraordinary circumstances and should be made by the student's tutor to the Senior Lecturer (via Student Cases) and only after consulting the general and more detailed school or course regulations regarding absence from lectures or examinations through illness.

22 Students who are unable to attend lectures (or other forms of teaching) due to disability should immediately contact the Disability Service to discuss the matter of a reasonable accommodation. Exceptions to attendance requirements for a student, on disability grounds, may be granted by the Senior Lecturer following consultation with the student's school, department or course office, and the Disability Service.

23 Students who find themselves incapacitated by illness from attending lectures (or other forms of teaching) should immediately see their medical advisor and request a medical certificate for an appropriate period. Such medical certificates should be copied to the school, department or course office, as appropriate, by the student's tutor.

Academic Integrity

Academic integrity can be described as a commitment to, and compliance with: *"ethical and professional principles, standards, practices and consistent system of values, that serve as guidance for making decisions and taking actions in education, research and scholarship"* (NAIN Lexicon, p.3) ¹

Trinity is committed to upholding academic integrity, and recognises that it underpins all aspects of university life, including all activities relating to research, learning, assessment, and scholarship. Trinity therefore considers academic misconduct to be serious and academically fraudulent and an offence against academic integrity that is subject to the Trinity procedures in cases of suspected misconduct.

Plagiarism is classed as Academic Misconduct and is considered a serious offence in Trinity and carries a range of penalties depending on the severity of the offence. Plagiarism is using someone else's ideas, charts, concepts, code or words in your assignments and using them as if they were your own, and without giving credit to the actual author. The School of Physics in addition interprets the use of Generative AI in submission of writing or coding assignments awhile passing this off as if the work was your own as a violation of academic integrity. Writing with academic integrity, that is, not plagiarising ideas or representing work you have not done yourself as your own, is a key expectation of Trinity students.

The emphasis should thus be on good academic practice and the development of your own academic writing skills or coding skills. To ensure that you have a clear understanding of good academic practice and to help you understand and avoid academic misconduct while practising your academic writing skills, there is a repository of information and extensive introduction at <https://libguides.tcd.ie/academic-integrity> .

The ways in which Trinity deals with cases of Academic Misconduct are detailed at: <https://www.tcd.ie/teaching-learning/academic-affairs/academic-integrity/>

- Academic Integrity Introduction (formerly Avoiding Plagiarism): <https://libguides.tcd.ie/academic-integrity>
- Ready Steady Write tutorial: <https://libguides.tcd.ie/academic-integrity/ready-steady-write>
- Coversheet declaration: <https://libguides.tcd.ie/academic-integrity/declaration>
- Consequences of academic misconduct: <https://www.tcd.ie/teaching-learning/academic-affairs/academic-integrity/consequences/>

Correct referencing is essential when crediting your sources and avoiding plagiarism. Your course handbook will tell you what style of referencing you should use in your assignments so

¹ National Academic Integrity Network – Lexicon available at <https://www.qqi.ie/what-we-do/engagement-insights-and-knowledge-sharing/national-academic-integrity-network>

be sure to check that out before you start any assignments. You will waste a lot of time if you have to redo your references.

College regulations on Academic Integrity

The School of Physics strictly implements Trinity College Dublin's policy on academic integrity.

Academic Integrity (excerpt from the College Calendar, Part II Undergraduate Studies)
available from: <https://www.tcd.ie/calendar/undergraduate-studies/>

96 General

It is clearly understood that all members of the academic community use and build on the work and ideas of others. However, it is essential that we do so with integrity, in an open and explicit manner, and with due acknowledgement.

Any action or attempted action that undermines academic integrity and may result in an unfair academic advantage or disadvantage for any member of the academic community or wider society may be considered as academic misconduct. Examples of academic misconduct can be found in the [curriculum glossary](#).

97 Academic misconduct in the context of group work

Students should normally submit assessments and/or examinations done in co-operation with other students only when the co-operation is done with the full knowledge and permission of the lecturer concerned. Without this permission, submitting assessments and/or examinations which are the product of collaboration with other students may be considered to be academic misconduct.

When work is submitted as the result of a group project, it is the responsibility of all students in the group to ensure, so far as is possible, that no work submitted by the group is plagiarised, or that any other academic misconduct has taken place. In order to avoid academic misconduct in the context of collaboration and group work, it is particularly important to ensure that each student appropriately attributes work that is not their own.

Should a module co-ordinator suspect academic misconduct in a group assignment, the procedure in cases of suspected academic misconduct must be followed for each student.

98 Avoiding academic misconduct

Students should ensure the integrity of their work by seeking advice from their module co-ordinator, tutor or supervisor on avoiding academic misconduct. All schools and departments must include, in their handbooks or other literature given to students, guidelines on the appropriate methodology for the kind of work that students will be expected to undertake. In addition, a general set of guidelines for students on avoiding academic misconduct is available at <https://libguides.tcd.ie/academic-integrity>.

99 Procedure in cases of suspected academic misconduct

If academic misconduct as referred to in §96 above is suspected, the procedure in cases of suspected academic misconduct, available at <https://www.tcd.ie/teaching-learning/academic-affairs/academic-integrity/> must be followed.

The case may be referred to the Junior Dean if:

- (i) the facts of the case are in dispute;
- (ii) the regulations of the College were not properly applied in the student's case;

(iii) the Director of Teaching and Learning (Undergraduate), or designate, forms the view that that the consequences provided for under the academic misconduct procedure are inappropriate given the circumstances of the case.

The Junior Dean will interview the student and may implement the procedures as referred to under CONDUCT AND COLLEGE REGULATIONS §2. Nothing provided for under the procedure in cases of suspected academic misconduct diminishes or prejudices the disciplinary powers of the Junior Dean under the 2010 Consolidated Statutes.

Script Viewing Process

All students have a right to discuss their examination and assessment performance with the appropriate members of staff. Students are entitled to view their scripts and other assessments in person when discussing their performance. For work completed during semester one, students should note that all results are provisional until moderated by the court of examiners in Trinity term. In Trinity term, students' performance cannot be discussed with them until after the publication of the end-year results. The School of Physics allows students to firstly view scripts and then seek an appointment to then obtain feedback on the examination script from the examiner. To preserve the integrity of the examination script the process below is adhered to rigidly.

Script Viewing Process in the School of Physics

- Initial script viewings take place in the School Office. You should contact the School Administration Team to arrange a suitable date / time. Please note that due to the large volume of requests that are received immediately after publication of examination results these can take time to organise.
- Scripts can only be viewed by the individual student concerned. You cannot have someone else represent you.
- Scripts must be viewed in person only. They cannot be viewed online.
- Have your student ID ready to show.
- You cannot write on the scripts.
- You cannot take photographs of the scripts.
- You cannot take notes.
- You can contact any relevant examiners later if you wish. They will be able to go through your script with you to provide further feedback.

Regulations surrounding re-check/re-mark of examination scripts

- The full set of College regulations are outlined in the [College Calendar](#) (page 39).
- The information below is taken from the Senior Tutor's Office website (<https://www.tcd.ie/seniortutor/students/undergraduate/>):

First of all, once the results are published you should discuss your examination/assessment performance with the examiners to understand why a specific mark was awarded.

Please note that these consultations are not an opportunity to negotiate an increase of your marks. Lecturers cannot change any marks once they have been approved by the Court of Examiners.

You are entitled to view your script when discussing your examination or assessment.

If you are still unhappy with your result and you have reason to believe that:

- a. The grade is incorrect because of an error in calculation of results,
- b. The examination paper contained questions on subjects which were not part of the course prescribed for the examination, or
- c. Bias was shown by the examiner in marking the script,
 - In the case of a. above, the School will recalculate your mark and request permission for the Senior Lecturer's Office for a mark change.
 - In the case of either b. or c. above, you should contact your Tutor to discuss the situation. Your Tutor can request a re-mark. Please note that ground b. applies to the class as a whole, not to individual students. Please also note that ground c requires evidential proof that bias from the examiner has occurred in marking the script.

Junior and Senior Fresh Physics

Physical Sciences Students (Junior and Senior Fresh)

There is a separate Course handbook available for each Fresher year in the Physical Sciences which are available at: <https://www.tcd.ie/science/undergraduate/tr063-physical-sciences/>

For the Junior Fresh Physical Sciences see: <https://www.tcd.ie/science/undergraduate/tr063-physical-sciences/junior-fresh/> and for the Senior Fresh Physical Sciences see: <https://www.tcd.ie/science/undergraduate/tr063-physical-sciences/senior-fresh/>.

Please consult the appropriate Physical Sciences Course handbook for the Junior Fresh and Senior Fresh years in Physical Sciences.

Regulations on Progression and Reassessment specific to the Fresher years in Physical Sciences are detailed in this School of Physics Undergraduate Handbook, as well as in the two Physical Sciences Course handbooks.

Physical Sciences Students (Junior and Senior Sophister)

For details on progression to the Junior Sophister year in the Physical Sciences course and for entry into one of the three Moderatorships accessible from Physical Sciences, namely the **Physics** Moderatorship, the **Physics and Astrophysics** Moderatorship and the **Nanoscience** Moderatorship, then see the Physical Sciences TR063 Sophister Programme Booklet. This is at: <https://www.tcd.ie/science/undergraduate/tr063-physical-sciences/junior-sophister/>

The details of the allocation of places into these Moderatorships is detailed in the Sophister Programme booklet and at that webpage.

Information on the course structure in both Junior and Senior Sophister years is in the Physical Sciences Sophister Programme booklet, inclusive of the detailed Optional module choices in these years that are available to students.

Regulations on Reassessment specific to the Sophister years in all the Physical Sciences degree programmes are detailed in this School of Physics Undergraduate Handbook, as well as in the Physical Sciences Sophister Programme booklet.

Junior Fresh Theoretical Physics

In the Junior Fresh year, Theoretical Physics students take prescribed Physics modules (20 credits) specified here and Mathematics modules (40 credits) specified by the School of Mathematics.

PYU11T10 Physics for Theoretical Physics – 10 credits

Semester 1 – 45 lectures, practical laboratory, online assignments & small group tutorials

PYU11T20 Physics for Theoretical Physics – 10 credits

Semester 2 – 47 lectures, practical laboratory, online assignments & small group tutorials

Further details, including learning outcomes, are given for all modules in the *Index of Modules*.

JF Practical Laboratory Classes – Semester 1, Semester 2

Students attend a 3-hour experimental/computational laboratory once a week.

JF Group Tutorials – Semester 1, Semester 2

Every student is assigned to a tutorial group with other students. The tutorials will be delivered on the topics in the JF year by academic members of staff or by the lecturers of those topics.

Exams

Information about the examinations will be made available on the Academic Registry website. Each module, PYU11T10 and PYU11T20, is normally examined in a separate examination paper during the relevant end of semester exam session. The overall mark in each module is calculated as the weighted average of the exam mark (60%), the laboratory practical mark (30%) and online tutorial mark (10%). If a student does not achieve a pass grade in a module, the student must either achieve a Qualified Pass, according to the rules of the course they are taking, or present for reassessment in the module.

Important Note on Examinations and Assessments

There is a minimum mark requirement of 30% separately in the Examination component and the Laboratory component, in order for a Pass or Qualified Pass mark in the module to be granted. Other components making up fewer marks are not included in this requirement. A mark of less than 30% in either of these Examination or Laboratory components leads to a Qualified Fail, and requires reassessment, supplemental examination or a repeat of the year. Further, any reassessed components are capped at a maximum mark of 60%. This is detailed in this School of Physics Undergraduate Handbook. See section on Progression.

Senior Fresh Theoretical Physics

In the Senior Fresh year, Theoretical Physics students take prescribed Physics modules (20 credits) specified below and Mathematics modules (20 credits) specified by the School of Mathematics, one 5 credit Trinity Elective in each semester, and choose the remaining 10 credits from among Mathematics and Statistics Open Modules.

PYU22T10 Classical Physics for Theoretical Physics – 10 credits

Semester 1 – 48 lectures, practical laboratory, project, online assignments and tutorials

PYU22T20 Modern Physics for Theoretical Physics – 10 credits

Semester 2 – 52 lectures, practical laboratory, online assignments and tutorials

Further details including learning outcomes are given for all modules in the *Index of Modules*.

Practical Laboratory Classes – Semester 1, Semester 2

All SF students are required to attend one 3-hour laboratory session each week. A series of experiments and computational exercises are provided to illustrate some key results presented in the lecture courses. The experiments are longer than in the JF year and are designed to continue the development of personal initiative as well as experimental and computational skills. Students prepare written reports on these experiments, which are assessed during the year. Students have oral interviews on these experiments and reports with an academic.

Group Study Projects – Semester 1

All students are required to investigate a given topic in Physics and present their findings in the form of a poster. Students work in groups of about five. Projects are carried out in Semester 1.

Full Cohort Tutorials – Semester 1, Semester 2

Students are required to attend tutorials, which are intended to deepen their understanding of concepts taught in lectures.

Exams

Information about examinations will be made available on the Academic Registry website. Each module, PYU22T10 and PYU22T20, is examined in a separate examination paper during the relevant end of semester exam session. The overall mark is calculated as follows: PYU22T10 as the weighted average of the exam mark (60%), the laboratory practical mark (25%), the tutorial mark (10%) and the project mark (5%). PYU22T20 as the weighted average of the exam mark (60%), the laboratory practical mark (30%) and the tutorial mark (10%). If a student does not achieve a pass grade in a module the student must either achieve a Qualified Pass or present for reassessment in the module.

Important Note on Examinations and Assessments

There is a minimum mark requirement of 30% separately in the Examination component and the Laboratory component, in order for a Pass or Qualified Pass mark in the module to be granted. Other components making up fewer marks are not included in this requirement. A mark of less than 30% in either of these Examination or Laboratory components leads to a Qualified Fail, and requires reassessment, supplemental examination or a repeat of the year. Further, any reassessed components are capped at a maximum mark of 60%. This is detailed in this School of Physics Undergraduate Handbook. See section on Progression.

Junior Sophister Physics

The JS year consists of lectures, tutorials and practicals delivered in modules, as listed below. Students receive training in communication skills within the practical module. Students also choose at least one Trinity Elective (TE) module.

The following modules are mandatory.

PYU33P01 Quantum Mechanics I – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33P02 Electromagnetic Interactions I – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33P03 Condensed Matter I – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33P04 Condensed Matter II – 5 credits

Semester 2 – 30 lectures/tutorials

PYU33P15 Atomic Physics and Statistical Thermodynamics – 5 credits

Semester 2 – 30 lectures/tutorials

PYU33PP3 JS Physics Laboratory – 10 credits

Semester 1 and Semester 2 – 20 lectures/11 laboratories

PYU33PP4 JS Physics Laboratory – 5 credits

Semester 2 – 7 laboratories

Open Modules: Students must choose from the following modules (maintaining 30 credits per semester):

PYU33A03 Stellar and Galactic Structure – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33A17 Astrophysics Techniques – 5 credits

Semester 2 – 30 lectures/tutorials

PYU33C01 – Computer Simulation I – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33P07 – Experimental Techniques – 5 credits

Semester 2 – 30 lectures/tutorials

At least One Trinity Elective Module – 5 credits

Either in Semester 1 or Semester 2, or one in each Term.

See <https://www.tcd.ie/trinity-electives/>

Further details including learning outcomes are given for all modules in the *Index of Modules*.

Assessment and Examination Procedures

Each 5-credit lecture module will be examined separately in the relevant end of semester examination period, with the exception, e.g., of PYU33C01 which is assessed entirely by continuous assessment. In cases where the module is taught in two parts, students must answer one question relating to each of the two parts of the module.

If a 5-credit module is assessed partly by continuous assessment the number of exam questions offered and to be answered may vary. The details of the assessment are given in the *Index of Modules* (see end of this handbook).

If a student does not achieve a pass grade in a module they must either achieve qualified pass (p. 9) or take a supplemental assessment in the failed components of that module. Marks in the supplemental exams are calculated in the same way as in the end of semester exams, and factor in the marks of already passed components to calculate the module mark.

Continuous assessment of the practical modules (PYU33PP3/4) contributes 15 credits.

Important Note on Examinations and Assessments and Reassessments in Sophister years

In the case of students needing to be reassessed in any component of any module (except Trinity Electives), the reassessed components are capped at a maximum mark of 60%. This is detailed in this School of Physics Undergraduate Handbook. See section on Progression.

Junior Sophister Theoretical Physics

The JS year consists of lectures, tutorials and practicals delivered in modules. Students receive training in communication skills within the practical module, as listed below. In their Junior Sophister year students taking the Theoretical Physics Moderatorship course take modules in Mathematics (total 30 credits), Physics modules (20 credits), and a further 10 credits from a range of open modules from Mathematics, Physics, and Statistics (options may be restricted depending on the demand and conditions in a given year), totalling 30 credits per semester.

Mandatory modules:

PYU33P03 Condensed Matter I – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33P15 Atomic Physics and Statistical Thermodynamics – 5 credits

Semester 2 – 30 lectures/tutorials

PYU33TP1 Practical in Theoretical Physics – 10 credits

Semester 1, Semester 2 – experimental and computational laboratory classes, seminars and communications workshops

Optional Modules: Students may choose *one* of the following open physics modules:

PYU33A03 Stellar and Galactic Structure – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33C01 – Computer Simulation I – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33P04 Condensed Matter II – 5 credits

Semester 2 – 30 lectures/tutorials

Further details including learning outcomes are given for all modules in the *Index of Modules*.

Assessment and Examination Procedures

Each 5-credit lecture module will be examined separately in the relevant end of semester examination period, with the exception, e.g., of PYU33C01 which is assessed entirely by continuous assessment. In cases where the module is taught in two parts, students must answer one question relating to each of the two parts of the module.

If a 5-credit module is assessed partly by continuous assessment the number of exam questions offered and to be answered may vary. The details of the assessment are given in the *Index of Modules* (see end of this handbook).

If a student does not achieve a pass grade in a module they must either achieve qualified pass (p. 9) or take supplemental assessment in the failed components of that module. Marks in the supplemental exams are calculated in the same way as in the end of semester exams, and factor in the marks of already passed components to calculate the module mark.

Continuous assessment of the practical module (PYU33TP1) contributes 10 credits.

Important Note on Examinations and Assessments and Reassessments in Sophister years

In the case of students needing to be reassessed in any component of any module, the reassessed components are capped at a maximum mark of 60%. This is detailed in this School of Physics Undergraduate Handbook. Note especially that this applies to all modules in the Junior Sophister year in Theoretical Physics, irrespective of the owning School, i.e. whether it is a School of Maths, School of Physics or School of Computer Science and Statistics module with MAU, PYU and STU module codes. See section on Progression.

Junior Sophister Physics and Astrophysics

The JS year consists of lectures, tutorials and practicals delivered in modules, as listed below. Students receive training in communication skills within the practical module. Students also choose at least one Trinity Elective (TE) module.

The following modules are mandatory.

PYU33P01 Quantum Mechanics I – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33P02 Electromagnetic Interactions I – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33P03 Condensed Matter I – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33A03 Stellar and Galactic Structure – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33A17 Astrophysics Techniques – 5 credits

Semester 2 – 30 lectures/tutorials

PYU33AP3 JS Astrophysics Computational Laboratory – 10 credits

Semester 1, Semester 2 – 20 lectures/12 laboratories

PYU33AP4 JS Physics Laboratory – 5 credits

Semester 2 – 10 laboratories

Open Modules: Students must take one specific designated Open module:

PYU33P15 Atomic Physics and Statistical Thermodynamics – 5 credits

Semester 2 – 30 lectures/tutorials

They choose from the following other Open modules (maintaining 30 credits per semester):

PYU33P04 Condensed Matter II – 5 credits

Semester 2 – 30 lectures/tutorial

PYU33P07 – Experimental Techniques – 5 credits

Semester 2 – 30 lectures/tutorials

PYU33C01 – Computer Simulation I – 5 credits

Semester 1 – 30 lectures/tutorials

At least One Trinity Elective Module – 5 credits

Either in Semester 1 or Semester 2, or one in each Term.

See <https://www.tcd.ie/trinity-electives/>

Further details including learning outcomes are given for all modules in the *Index of Modules*.

Assessment and Examination Procedures

Each 5-credit lecture module will be examined separately in the relevant end of semester examination period, with the exception, e.g., of PYU33C01 which is assessed entirely by continuous assessment. In cases where the module is taught in two parts, students must answer one question relating to each of the two parts of the module.

If a 5-credit module is assessed partly by continuous assessment the number of exam questions offered and to be answered may vary. The details of the assessment are given in the *Index of Modules* (see end of this handbook).

If a student does not achieve a pass grade in a module they must either achieve qualified pass (p. 9) or take supplemental assessment in the failed components of that module. Marks in the supplemental exams are calculated in the same way as in the end of semester exams, and factor in the marks of already passed components to calculate the module mark.

Continuous assessment of the practical modules (PYU33AP3/4) contributes 15 credits.

Important Note on Examinations and Assessments and Reassessments in Sophister years

In the case of students needing to be reassessed in any component of any module (except Trinity Electives), the reassessed components are capped at a maximum mark of 60%. This is detailed in this School of Physics Undergraduate Handbook. See section on Progression.

Junior Sophister Nanoscience

Physics for Junior Sophister Nanoscience students consists of lectures and tutorials delivered in modules, as listed below. There are prescribed modules in Physics (20 credits) as listed below. The balance is made up of prescribed modules in Chemistry (20 credits). The practical advanced materials and nanoscience laboratory module (10 credits) includes laboratory classes and an introduction to experimental techniques for nanoscience carried out in the research laboratories in CRANN (conditions permitting). Students also receive training in communication skills within the practical module. There are further designated Open modules in the first semester which must be taken, both in Physics.

The following School of Physics modules are mandatory.

PYU33P01 Quantum Mechanics I – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33NP3 Nanoscience Physics Laboratory – 10 credits

Semester 1 and Semester 2 – 20 Lectures and 12 laboratories

Open Modules: Students must take both specific designated School of Physics Open modules:

PYU33P03 Condensed Matter I – 5 credits

Semester 1 – 30 lectures/tutorials

PYU33P02 Electromagnetic Interactions I – 5 credits

Semester 1 – 30 lectures/tutorials

They then choose from the following other Open module from the School of Physics or alternatively an Open module from the School of Chemistry:

PYU33P04 Condensed Matter II – 5 credits

Semester 2 – 30 lectures/tutorials

One Trinity Elective Module – 5 credits

The Trinity Elective must be in Semester 2 – See <https://www.tcd.ie/trinity-electives/>

Chemistry modules contributing to the Nanoscience Moderatorship are listed in the Sophister Physical Sciences Programme Handbook at [Junior Sophister - Science | Trinity College Dublin \(tcd.ie\)](https://www.tcd.ie/junior-sophister-science/) and on the School of Chemistry website and diagrammatically visualised at <https://www.tcd.ie/physics/study/current/undergraduate/>.

Further details including learning outcomes are given for all modules in the *Index of Modules*.

Assessment and Examination Procedures

Each 5-credit lecture module will be examined separately in the relevant end of semester examination period. In cases where the module is taught in two parts, students must answer one question relating to each of the two parts of the module.

If a 5-credit module is assessed partly by continuous assessment the number of exam questions offered and to be answered may vary. The details of the assessment are given in the *Index of Modules* (see end of this handbook).

If a student does not achieve a pass grade in a module they must either achieve qualified pass (p. 9) or take supplemental assessment in the failed components of that module. Marks in the supplemental exams are calculated in the same way as in the end of semester exams, and factor in the marks of already passed components to calculate the module mark.

Continuous assessment of the practical module in Nanoscience contributes 10 credits. The balance of credits comes from Chemistry modules.

Important Note on Examinations and Assessments and Reassessments in Sophister years

In the case of students needing to be reassessed in any component of any module (except Trinity Electives), the reassessed components are capped at a maximum mark of 60%. Note especially that this applies to all modules (except Trinity Electives) within Nanoscience, irrespective of the owning School, i.e. whether it is a School of Physics or School of Chemistry module with PYU or CHU module codes This is detailed in this School of Physics Undergraduate Handbook. See section on Progression.

Senior Sophister Physics

The SS year consists of lectures, tutorials and practicals delivered in modules, as listed below. The major and sole component of the practical module (PYU44PP2) is an independent research capstone project, which is carried out ordinarily during the first 9 weeks of Semester 1, with no lectures during this period. Assessment of the project occurs in Semester 2. Students select physics Open Modules totalling 20 credits.

The following modules are mandatory.

PYU44P11 Advanced Quantum Mechanics, Nuclear Structure and High Energy Physics – 10 credits

Semester 1, Semester 2 – 48 lectures/tutorials

PYU44P05 Electromagnetic Interactions II – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44PP2 Physics Research Project – 20 credits

Semester 1, Semester 2 – Research Project

PYU44PP5 Problem Solving in Physics – 5 credits

Semester 1 – Problem Solving Tutorials and Seminars

Open Modules (PYU44P16 and PYU44A05 cannot both be selected):

PYU44P13 Magnetism & Superconductivity – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44P06 Modern Optics – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44P16 Quantum Plasmonic and Metamaterials * – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44P17 Energy Science – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44N02 Nanoscience, Complex Fluids & Polymers – 10 credits

Semester 1, Semester 2 – 48 lectures/tutorials

PYU44T20 Quantum Optics & Information – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44C01 Computer Simulation II – 5 credits

Semester 2 – 26 lectures/tutorials

*** PYU44P16 and PYU44A05 cannot both be selected**

Further details including learning outcomes are given for all modules in the *Index of Modules*.

Note that optional modules may be withdrawn if less than five students opt for that module.

Students will be invited to choose their optional modules at the beginning of Semester 1.

Please note that there will be a short window at the beginning of Semester 2 to change modules.

It will not be possible to change modules after 24th January 2025.

Assessment and Examination Procedures

In order to pass the year and be awarded a Moderatorship degree every student must pass each module and gain an overall mark of at least 40%. The overall end-of-year mark and grade is calculated based on the credit-weighted average of the module marks. If a student does not achieve a pass grade in a module they must either achieve qualified pass (p. 9) or take supplemental assessment in failed components of that module. Marks in the supplemental exams are calculated in the same way as in the end of semester exams.

Each 5-credit lecture module will be examined separately in the relevant end of semester examination period with the exception of any designated module which is assessed entirely by continuous assessment. In cases where a 5-credit module is taught in two parts, students must answer one question relating to each of the two parts of the module. Each component part of a 10 credit lecture modules is ordinarily examined in its corresponding end of semester examination period.

If a module is assessed partly by continuous assessment the number of exam questions offered and to be answered may vary. The details of the assessment are given in the *Index of Modules* (see end of this handbook).

The problem-solving module PYU44PP5 is normally assessed by a 3-hour examination in the Semester 1 examination period. The project PYU44PP2 is assessed during Semester 2.

Important Note on Examinations and Assessments and Reassessments in Sophister years

In the case of students needing to be reassessed in any component of any module (except Trinity Electives), the reassessed components are capped at a maximum mark of 60%. This is detailed in this School of Physics Undergraduate Handbook. See section on Progression.

Senior Sophister Theoretical Physics

The SS year consists of lectures, tutorials, attendance at the School Seminar series, and a research project. It is delivered in modules, as listed below. In their final year Theoretical Physics take the compulsory Semester 1 5-credit module PYU44PP5 along with a 20-credit yearlong Capstone Project in either Mathematics (MAU44P00) or Physics (PYU44TP1). All remaining modules are optional, but they are subject to some restrictions.

Mandatory Taught Module (5 credits):

PYU44PP5 Problem-Solving – 5 credits
Semester 1 – Problem-Solving Tutorials and Seminars

Mandatory Project (20 credits):

PYU44TP1 Research Project – 20 credits
OR MAU44P00 Project – 20 credits

Semester 1, Semester 2 – Research project, meetings with supervisor by arrangement.

School of Physics Optional Taught Modules (PYU44P16 and PYU44A05 cannot both be selected):

PYU44T10 Condensed Matter Theory – 5 credits

Semester 1 – 24 lectures/tutorials

PYU44P12 Nuclear Structure and High Energy Physics – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44T20 Quantum Optics and Information – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44P16 Quantum Plasmonic and Metamaterials * – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44P17 Energy Science – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44A05 Cosmology *† – 5 credits

Semester 2 – 20 lectures/tutorials

PYU44C01 Computer Simulation III – 5 credits

Semester 2 – 24 lectures/tutorials

* PYU44P16 and PYU44A05 cannot both be selected

Further details including learning outcomes are given for all modules in the *Index of Modules*.

Note that optional modules may be withdrawn if less than five students opt for that module.

Students will be invited to choose their optional modules at the beginning of Semester 1. Please note that there will be a short window at the beginning of Semester 2 to change modules. **It will not be possible to change modules after 24th January 2025.**

Assessment and Examination Procedures

In order to pass the year and be awarded a Moderatorship degree every student must pass each module and gain an overall mark of at least 40%. The overall end-of-year mark and grade is calculated based on the credit-weighted average of the module marks (both Physics and Maths modules). If a student does not achieve a pass grade in a module they must either achieve a qualified pass (p. 9) or take supplemental assessment in the failed components of that module.

Each 5-credit lecture module will be examined separately in the relevant end of semester examination period, with the exception, e.g., any designated module which is assessed entirely by continuous assessment. In cases where a 5-credit module is taught in two parts, students must answer one question relating to each of the two parts of the module.

If a module is assessed partly by continuous assessment the number of exam questions offered and to be answered may vary. The details of the assessment are given in the *Index of Modules* (see end of this handbook).

The problem-solving module PYU44PP5 is normally assessed by a 3-hour examination in the semester 1 examination period.

Important Note on Examinations and Assessments and Reassessments in Sophister years

In the case of students needing to be reassessed in any component of any module, the reassessed components are capped at a maximum mark of 60%. This is detailed in this School of Physics Undergraduate Handbook. Note especially that this applies to all modules in the Senior Sophister year in Theoretical Physics, irrespective of the owning School, i.e. whether it is a School of Maths or School of Physics module with MAU and PYU module codes. See section on Progression.

Senior Sophister Physics and Astrophysics

The SS year consists of lectures, tutorials and practicals delivered in modules, as listed below. A major component of the practical module (PYU44PP2) is an independent capstone research project, which is carried out ordinarily during the first 9 weeks of Semester 1, with no lectures during this period. Students select physics Open Modules totalling 10 credits.

The following modules are mandatory.

PYU44A01 Cosmology, Planetary and Space Science – 10 credits

Semester 1, Semester 2 – 44 lectures/tutorials

PYU44P11 Advanced Quantum Mechanics, Nuclear Structure and High Energy Physics – 10 credits

Semester 1, Semester 2 – 48 lectures/tutorials

PYU44P05 Electromagnetic Interactions II – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44PP2 Physics Research Project – 20 credits

Semester 1, Semester 2 – Research Project

PYU44PP5 Problem Solving in Physics – 5 credits

Semester 1 – Problem Solving Tutorials and Seminars

Open Modules:

PYU44P13 Magnetism & Superconductivity – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44P06 Modern Optics – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44P17 Energy Science – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44C01 Computer Simulation II – 5 credits

Semester 2 – 24 lectures/tutorials

Further details including learning outcomes are given for all modules in the *Index of Modules*.

Note that optional modules may be withdrawn if less than five students opt for that module.

Students will be invited to choose their optional modules at the beginning of Semester 1. Please note that there will be a short window at the beginning of Semester 2 to change modules. **It will not be possible to change modules after 24th January 2025.**

Assessment and Examination Procedures

In order to pass the year and be awarded a Moderatorship degree every student must pass each module and gain an overall mark of at least 40%. The overall end-of-year mark and grade is calculated based on the credit-weighted average of the module marks. If a student does not achieve a pass grade in a module they must either achieve a qualified pass (p. 9) or take supplemental assessment in the failed components of that module. Marks in the supplemental exams are calculated in the same way as in the end of semester exams.

Each 5-credit lecture module will ordinarily be examined separately in the relevant end-of-semester examination period. In cases where a 5-credit module is taught in two parts, students must answer one question relating to each of the two parts of the module. Each component part of 10 credit lecture modules is ordinarily examined in its corresponding end of semester examination period.

If a module is assessed partly by continuous assessment the number of exam questions offered and to be answered may vary. The details of the assessment are given in the *Index of Modules* (see end of this handbook).

The problem-solving module PYU44PP5 is normally assessed by a 3-hour examination in the semester 1 examination period. The project PYU44PP2 is assessed during semester 2.

Important Note on Examinations and Assessments and Reassessments in Sophister years

In the case of students needing to be reassessed in any component of any module (except Trinity Electives), the reassessed components are capped at a maximum mark of 60%. This is detailed in this School of Physics Undergraduate Handbook. See section on Progression.

Senior Sophister Nanoscience

Physics for Senior Sophister Nanoscience students consists of lectures, tutorials and practicals delivered in modules, as listed below. A major component of the practical module is an independent capstone research project, which may be carried out in the School of Physics or in the School of Chemistry or at a facility off-campus (conditions permitting). Students select physics and/or chemistry Open Modules totalling 15 credits.

The following modules are mandatory.

PYU44N02 Nanoscience, Complex Fluids & Polymers – 10 credits

Semester 1, Semester 2 – 48 lectures/tutorials

PYU44NP2 Physics Research Project – 20 credits

Semester 2 – Research Project

PYU44NP5 Problem Solving in Physics – 5 credits

Semester 1 – Problem Solving Tutorials and Seminars

Open Modules (only School of Physics modules are shown):

PYU44P13 Magnetism & Superconductivity – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44P05 Electromagnetic Interactions II – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44P06 Modern Optics – 5 credits

Semester 2 – 24 lectures/tutorials

PYU44P17 Energy Science – 5 credits

Semester 2 – 24 lectures/tutorials

Further details including learning outcomes are given for all modules in the *Index of Modules*.

Note that optional modules may be withdrawn if less than five students opt for that module.

Students will be invited to choose their optional modules at the beginning of Semester 1. Please note that there will be a short window at the beginning of Semester 2 to change modules.

It will not be possible to change modules after 24th January 2025.

Assessment and Examination Procedures

In order to pass the year and be awarded a Moderatorship degree every student must pass each module and gain an overall mark of at least 40%. The overall end-of-year mark and grade is calculated based on the credit-weighted average of the module marks (both Physics and Chemistry modules). If a student does not achieve a pass grade in a module they must either achieve qualified pass (p. 9) or take supplemental assessment in the failed components of that module. Marks in the supplemental exams are calculated in the same way as in the end of semester exams.

Each 5-credit lecture module will ordinarily be examined separately in the relevant end of semester examination period. In cases where a 5-credit module is taught in two parts, students must answer one question relating to each of the two parts of the module. Each component part of 10 credit lecture modules is ordinarily examined in its corresponding end of semester examination period.

If a module is assessed partly by continuous assessment the number of exam questions offered and to be answered may vary. The details of the assessment are given in the *Index of Modules* (see end of this handbook).

The problem-solving module PYU44NP5 is normally assessed by a 3-hour examination in the semester 1 examination period. The project PYU44NP2 is assessed during semester 2.

The balance of credits comes from Chemistry modules.

Important Note on Examinations and Assessments

In the case of students needing to be reassessed in any component of any module (except Trinity Electives), the reassessed components are capped at a maximum mark of 60%. Note especially that this applies to all modules (except Trinity Electives) within Nanoscience, irrespective of the owning School, i.e. whether it is a School of Physics or School of Chemistry module with PYU or CHU module codes This is detailed in this School of Physics Undergraduate Handbook. See section on Progression.

General Guidelines

Grading criteria

Grades are distinguished as follows:

I	70% – 100%
II.1	60% – 69%
II.2	50% – 59%
III	40% – 49%
F1	30% – 39%
F2	0% – 29%

Study guidelines

The Study Skills Web Seminar (<https://student-learning.tcd.ie/learning-resources/study-skills/>) is an excellent site provided by the Student Counselling Service.

The aim of the Study Skills Web Seminar is to empower you to deal with the transition into third level education and with future changes in work situations.

There are dramatic changes as a result of moving into higher education in terms of the personal, social and financial aspects of your life. In terms of your learning, the biggest change is the need for you to take responsibility for your own learning. Courses in University demand more independent study and less contact time with teaching staff.

Timetables

Personalized timetables for each student are available on the student information system at my.tcd.ie.

Equality Policy

The Equality Policy, inclusive of information on Diversity and Inclusion training programmes, is detailed at <https://www.tcd.ie/equality/policy/equality-policy/>

Interactive maps of College campus can be found online at the link below. These include maps of facilities such as libraries, computer rooms, cafes and sports facilities.

www.tcd.ie/maps

Dignity, Respect and Consent

The University is committed to promoting a positive environment where everyone is treated with dignity and respect, where work and study is free from bullying, or any form of harassment. Everyone within the University community has a responsibility to behave in a respectful way by respecting the dignity of others and participate in creating a positive culture for work and study.

Bullying and harassment (including sexual and racial harassment) are not tolerated in Trinity.

We are committed to the development of a culture where disclosure/reporting of any instance of bullying or harassment is encouraged. The University has a duty to act if it becomes aware of bullying and harassment without a complaint being made (such as through anonymous reporting below).

If you are experiencing bullying or harassment, or if you are the subject of a complaint of bullying / harassment, your first point of contact is Dignity, Respect & Consent Service, who have staff trained to deal with such matters as a confidential service. You can opt to make a disclosure or to make a complaint. Making a disclosure does not constitute raising a complaint, however you may decide to submit a complaint after seeking and receiving advice from the DR&C Service.

Visit **Dignity, Respect & Consent (DR&C) Service**: <https://www.tcd.ie/hr/dignity-and-respect/>

Students: Information for students about making a disclosure, making a complaint, receiving a complaint, training and support services are at: <https://www.tcd.ie/hr/dignity-and-respect/students/>

Speak Out provides the opportunity for you to make the University aware of incidents that you have either experienced or witnessed by reporting them **anonymously**. <https://www.tcd.ie/hr/dignity-and-respect/speak-out/>

Policies: Both the Dignity and Respect Policy and the Sexual Misconduct Policy are available from: <https://www.tcd.ie/hr/dignity-and-respect/policies/>

Emergency contacts	
On-campus	College Emergency Telephone Number: +353 1 896 1999

Emergencies	On-Campus Security can be contacted in case of emergency on campus.
Off-campus Emergencies	An Garda Siochana (national Police Service of the Republic of Ireland) Call 999 or 112

Health and Safety

Health and Safety Induction and Health Declaration Forms

Junior Fresh Students

Junior Fresh students should complete the online Health and Safety Induction and Quiz using the Blackboard system before beginning any laboratory practical classes. This includes completion of the Health Declaration Forms.

School Safety Statement and Policy

Senior Sophister Students doing a Research Project

Before beginning an experimental research project, students must read the School safety statement, which can be found online at: www.tcd.ie/Physics/about/safety. Students must sign Appendices F and H of the safety statement and return them to the School Safety Officer.

Students who work with chemicals should pay particular attention to the chemicals section. Students who work with lasers must attend the laser safety seminar. General safety documents can be found at www.tcd.ie/physics/about/safety.

In the event of an emergency, dial Security Services on extension 1999 Security Services provide a 24-hour service to the college community, 365 days a year. They are the liaison to the Fire, Garda and Ambulance services.

Staff and students are advised to always telephone extension 1999 (+353 1 896 1999) in case of an emergency.

Should you require any emergency or rescue services on campus, you must contact Security Services. This includes chemical spills, personal injury or first aid assistance.

It is recommended that all students save at least one emergency contact in their phone under ICE (In Case of Emergency).

It is also recommended that students download the SafeZone app to access alerts for closures in inclement weather, etc.

School of Physics phone numbers relating to safety

Safety Officer	Mr. Joe McCauley	2218 (01-896 2218)

Student Supports

[Student services](#) make a crucial contribution to the student experience at Trinity College. The mission of student services is to provide opportunities of the highest quality for student development in an inclusive, caring and cost-effective way, consistent with the academic mission of College. [Here](#) is a list of the Student Services available in Trinity. You will find more information on each service's website.

Tutorial service

Trinity College assigns a tutor to each undergraduate student. Tutors are academic staff members who look after the welfare and development of a student in relation to their academic progress. They can advise on such matters as choosing courses, assessments and exams and act as an advocate in dealing with the university. She/he will be a source of help and guidance throughout your time as a student. See the [Senior Tutor's](#) website for further information.

Erasmus students have a co-ordinator whose function is similar to that of a tutor.

Student Counselling

The [Student Counselling Service](#) will help you to manage any difficulties you are experiencing so you can enjoy and fully participate during your time in College. It is a confidential and professional service that is available free of charge to every Trinity College student. It offers help in coping with any personal or emotional problems that may impact on your studies or progress in the University, and offers learning support and development aids. Visit the Student Counselling website to find out more about the services available, such as one-to-one sessions with a trained counsellor, group therapy and educational workshops, on-line support programmes, student-to-student support and more.

Learning Support and Development

On the Student Learning Support and Development Services' website (student-learning.tcd.ie/) you will find links to sites in College that can assist you with your learning support requirements.

Disability Service

The Disability Service's mission is to empower students with disabilities to achieve their potential and, in collaboration with students, engage the University community in creating an inclusive transformational environment and provide a platform for innovation and inclusion.

Service delivery within the Disability Service utilises a multi-disciplinary approach and is comprised of an experienced team of individuals who work to support the disabled student. The team includes Disability Officers who are Psychologists, Occupational Therapists, and an Assistive Technologist, all of whom seek to offer quality support based on individual need, as identified using a highly developed disability needs assessment process.

Disability Service Mission: To create an accessible, transformational, educational environment in an interdependent University community and provide a platform for innovation and inclusion.

Disability Service Vision: Engage the wider University community in empowering students with disabilities.

Disability Service Values: Inclusive, Advocating, Collaborative, Inquisitive, Pioneering, Positive disruptors, Dynamic.

The Disability Service has two principal functions, firstly, to provide supports to Trinity's disabled community (which comprises of students and staff, and indirectly; visitors) and to recommend policy and procedural changes as required. Secondly, the Disability Service ensures that Trinity is compliant with the Disability Act 2005 and other relevant legislation and codes of practice.

Student Disability Supports operate an appointment system to ensure that student queries and assessment interviews are handled in an efficient, effective, and confidential manner. Drop-in appointments can be made via the Disability Service Website.

The ethos of the Disability Service is to move from a transactional model of provision, where students are passive recipients of supports, to a transformational model of resource usage, where students take an active part in planning their educational journey. Trinity Disability Service is committed to coproduction of all activities with the student body. This is done through collaborative partnership with the TCD Ability co_op. The Trinity Ability co_op is a collaborative initiative between students, staff, and other stakeholders. The co_op provides opportunities for members to work together towards inclusion in Trinity. For more information or to find out how to join visit the Ability co_op webpage.

The Disability Service has a range of supports to ensure that students with disabilities have full access to the same facilities for study and recreation as their peers. The enabling disability supports provided by the Disability Service include:

- Exam Accommodations
- Library Supports
- Specialist Disability Supports:
 - o Autism Spectrum Support
 - o Neurodiversity Support
 - o Applications for Rooms on Campus
 - o Assistive Technology
 - o Communicating with your School
 - o Educational Support Work
 - o Erasmus Disability Support Programme
 - o Professional Placement Planning
 - o Respite Space
 - o Occupational Therapist Support
 - o Personal Emergency Evacuation Plan (PEEP)
 - o Planning your Career
 - o Student Lockers
 - o Irish Sign Language Support
 - o Dyslexia Consultation

After applying online, students will be invited to meet with a member of the Disability Service team (Disability Officer/Occupational Therapist) on a one-to-one basis to discuss and agree the enabling Disability Supports put in place to meet their needs

Contact Information

- Phone: 01 896 3111
- Text: 087 113 3185

The graphic is a purple-themed promotional poster for 'DS Solutions Drop-in'. On the left, a purple box contains the text 'Have a question?' in white, followed by an email icon and 'askds@tcd.ie', a phone icon and the numbers '01 896 3111' and '087 113 3185'. At the bottom left are logos for 'disAbility Hub' and 'Trinity College Dublin'. On the right, the text 'DS Solutions Drop-in' is in a large, bold font, with 'Monday to Friday 11 am to 3 pm (Term Time)' below it. A hand icon points to the text. Below that, it says 'Scan the QR code to book your Drop-in appointment' above a large QR code with a white arrow pointing up in the center.

Have a question? Email askds@tcd.ie Phone 01 896 3111 Mobile 087 113 3185

DS Solutions Drop-in. Monday to Friday, 11am to 3pm (Term Time). Scan the QR code to book your Drop-in appointment.

College Health Service

The [College Health Service](#) is in Printing House Square and is open every week day and provides inexpensive primary health and psychiatric care, by appointment. It is open Monday to Friday from 9.00 am to 5.00 pm.

Careers Advisory Service

What do you want to do? How will you get there? We are here to support you in answering these and other questions about your career. Visit: <https://www.tcd.ie/Careers/>

Junior and Senior Fresh Students

Get Involved: Remember that your course of study, extra- curricular activities, voluntary and part-time work all provide opportunities for developing skills and gaining an insight into your career preferences. In your Senior Fresh year, look out for short-term internship opportunities.

MyCareer: Log in to MyCareer to keep abreast of jobs, study and careers events of interest to you.

Junior Sophisters

Attend class seminar: Typically, this takes place for JS students in College in Semester 2 and includes information on applying for work experience and internships and postgraduate study. For JS students in the School of Physics, specific lectures on careers related to this take place in Semester 1 as part of JS students' practical modules. Further in the School of Physics, in Semester 2 networking events involving returning School of Physics graduates may occur.

Get work experience: The programme of summer work experience and internships is particularly relevant to Junior Sophisters. Personalise your MyCareer profile to receive email alerts tailored to your preferences.

MyCareer: Log in to MyCareer to keep abreast of jobs, study and careers events of interest to you.

Finalists and Senior Sophisters

Meet Employers and/or Explore Further Study: You may have decided to seek employment directly after graduation and many employers visit Dublin to actively seek out talented graduates. For others, further study may be their preferred option. Your MyCareer dashboard will keep you informed.

Find Jobs: Personalise your MyCareer profile to receive email alerts tailored to your interests.

Attend class seminar: Typically, this takes place in Semester 1 and includes information on applying for postgraduate study and jobs.

GradLink Mentoring: An opportunity to get advice and support from a Trinity graduate.

Drop-In CV/ LinkedIn Clinics: We also provide support at a practical level, helping you to improve your applications, which will benefit you in securing your future, whether in employment or further study.

Practice Interviews: A practice interview tailored to the job/ course of your choice with practical feedback.

MyCareer: Log in to MyCareer to keep abreast of jobs, study and careers events of interest to you.

MyCareer

An online service that you can use to:

- Apply for opportunities which match your preferences - vacancies including research options
- Search opportunities- postgraduate courses and funding
- View and book onto employer and CAS events
- Submit your career queries to the CAS team
- Book an appointment with your Careers Consultant

Simply login to MyCareer using your Trinity username and password and personalise your profile.

Careers Advisory Service

Opening Hours

During term: 9.00am – 1.00pm and 2.00pm - 5.00pm, Monday - Friday

Out of Term: 9.00am - 1.00pm and 2.00pm - 5.00pm, Monday - Friday

Information Technology Services

[Information Technology Services \(IT Services\)](#) is responsible for the provision and support of computer systems, networking, and audio-visual and media services in College.

During Freshers' Week it is well worth investing some time in finding out about the range of IT services that you can use as a TCD student. Once you have registered and obtained your computer username and password, you are invited to attend an IT induction session where you can find out about the services available to students. Topics covered include activating your TCD e-mail account, using the College Computer Rooms and College printing system, and accessing your timetable online. Also, if you own a computer, you'll find out about what's involved in bringing it into College, registering to use it on the College network and availing of College's Wi-Fi service.

Sports

Trinity College recognizes the important role that sport plays in a well-rounded university education and has a full range of [sports facilities](#) both on and off campus. All students are encouraged to participate. The Sports Centre has a 25-metre, 6-lane swimming pool, a large fitness theatre with over 60 exercise stations, an 11-metre-high climbing wall, a fitness studio, a spin studio, a sauna and steam room, and two large sports halls.

There are 50 sports clubs in Trinity College so no matter what your sporting preference you will find a club to suit you with options such as rugby, soccer, hockey, swimming, tennis, Gaelic games, basketball, volleyball, cricket and martial arts. Off-campus there are extensive playing fields at Santry, and the Trinity Boat Club has its boathouse on the River Liffey at Islandbridge.

Student Societies

There are societies like the Philosophical Society and the College Historical Society with their established debating tradition and impressive guest speakers, such as Pete Doherty, John C. Reilly, Robert Fisk and Archbishop Desmond Tutu. Others, like the Filmmakers Society, Trinity FM, the Trinity Arts Workshop and the Photography Society, have their own studios on campus and hold regular screenings, broadcast weeks, exhibitions and classes, respectively. You can try your hand at everything from acting to archaeology, politics to paintballing, and singing to sci-fi. You can relax with the Yoga society or de-stress in a different way with the Comedy Society

or the Food and Drink society. And if you don't find a society that interests you, you can always set one up yourself!

DU PhySoc

The Dublin University Physical Society is a student society dedicated to physics and fun. Traditionally these two words do not often appear in the same sentence, and some say that this is why the society exists! More formally, two of the core aims of the society (as stated in its constitution) are:

- To encourage the study of physics by members of the University
- To raise the standards of awareness of physics and its benefits among the community at large

The PhySoc provides a recreational outlet for everyone in the School of Physics, hosting events that are excellent opportunities for both students and staff to interact in a social environment. While everyone in the School of Physics is encouraged to join PhySoc, it attracts members from all areas of College. Anyone with even a passing interest in physics is welcome, and most of the talks are intended for a general audience. The PhySoc hosts receptions, quizzes, blood drives, movie nights, football matches, tournaments and themed parties along with both local and overseas trips - to name but a few of the activities. If you have any specific questions about DU PhySoc contact duphysoc@gmail.com.

Theoretical Physics Student Association (TPSA)

The Theoretical Physics Student Association (TPSA) was created for the benefit of students from both physics and maths backgrounds. The TPSA aspire to create a sustainable environment to encourage collaboration between students, develop their academic skill set, improve their internship and career prospects, and overall work towards improving the ecosystem of physics and maths in Ireland.

Among the activities listed by the TPSA are:

- Student seminars every week for students of all years to work through problems and gain valuable insight into the field from older students.

- Talks from high level researchers and senior students about exciting research topics and how to make the most of your time as an undergraduate.
- A student run lecture series for students from all years.
- Training students to represent TCD in the International Theoretical Physics Olympiad.

The TPSE provide numerous opportunities for students to get involved, and it hopes that the benefit of what it does will be felt inside and outside of TCD in years to come.

More information about the TPSE can be found on the website: <https://tpsa-ireland.github.io>

Index of Modules

The School reserves the right to amend the list of available modules and to withdraw and add modules. Timetabling may restrict the availability of modules to individual students.

PYU11T10 Physics for Theoretical Physics

Semester 1 – lectures, practical laboratory, online assignments & small group tutorials – 10 credits
(E. Keane, L. Matrà, C. Patterson, L. Bradley, D. O'Regan)

Introduction to Physics and Mastering Physics – 2 lectures

Special Relativity – 15 lectures

Waves and Optics I – 20 lectures

Statistics – 10 lectures

Learning Outcomes

On successful completion of this module, students should be able to:

- Express relativistic effects concerning the motion of a body, as observed in different inertial reference frames
- Describe wave motion and relate it to basic phenomena in light and sound
- Understand sources of errors in measurements and calculate their propagation.
- Prepare a brief report, including error analysis, on a simple physical experiment

Syllabus

What is Physics and What is Mastering Physics – 2 lectures

An introduction to the School of Physics, the JF Physics course and Mastering Physics.

Special Relativity – 15 lectures

Galilean transformations, Michelson-Morley experiment. Lorentz transformations, time dilation, length contraction, simultaneity. Doppler effect. Transformation of velocities and forces. Relativistic dynamics. Pair creation, fission, fusion. Collisions. Compton effect. Relativity and electromagnetism.

Waves and Optics I – 20 lectures

Resonance, harmonic oscillators, SHM, frequency.

Waves: standing, travelling, wavelength, wave velocity.

Sound: music, vibrations of a string and of a column of air, harmonics, Doppler effect.

Light: Rayleigh scattering, refraction, reflection, dispersion, index of refraction, polarization, polarized reflection, Malus' law, birefringence, total internal reflection, colour vision, gas discharges, lasers.

Optics: refracting optics, lenses, real images, focus, focal length,

f-numbers, lens equation, cameras, reflecting optics, curved mirrors, telescopes.

Interference: superposition of waves, beating, 2 beam interference, anti-reflection coating.

Diffraction: Huygen's principle, diffraction by a slit and grating, X-ray diffraction.

Statistics – 10 lectures

Systematic and random errors. Discrete and continuous distributions such as binomial, Poisson, Gaussian and Lorentzian. Moments of a distribution. Histograms and probability densities. Estimation of mean and standard deviation in a measurement. Error propagation and transformation of variables in probability distributions. Linear regression analysis, method of least squares, goodness of fit (Chi squared) and plotting techniques. Introduction to programming basics in Python.

Assessment	Weighting
Examination	60%
Laboratory Practical work	30%
Online assignments	10%

Note: There is a minimum mark requirement of 30% separately in the Examination component and the Laboratory component, in order for a Pass or Qualified Pass mark in the module to be granted. Other components making up fewer marks are not included in this requirement.

PYU11T20 Physics for Theoretical Physics

Semester 2 HT – lectures, practical laboratory, online assignments & small group tutorials – 10 credits
(A. Lunghi, P. Eastham, E. Keane)

Electricity and Magnetism I – 20 lectures

Quantum Physics – 18 lectures

Gravitation and Astrophysics – 12 lectures

Learning Outcomes

On successful completion of this module, students should be able to:

- Solve steady state time-varying electric current and electric potential problems
- Solve electrostatic problems using Gaussian Surfaces
- Show an understanding of the principles and origins of quantum mechanics, and its role in the physics of matter and radiation.
- Solve elementary problems in quantum mechanics
- Develop the ideas of Newton's Law of Gravitation, with an emphasis on it being an inverse-square law
- Describe observational insights into the structure and evolution of the universe.

Syllabus

Electricity and Magnetism I – 20 lectures

Electrostatics: electric charge, Coulomb's law, electric field, electric dipoles, Gauss's law, electric potential energy, voltage, electric polarization, capacitance, dielectrics, Electric current, resistance, Ohm's law, electromotive force, power in electric circuits, Kirchoff's laws, RC circuits. Magnetism, magnetic field lines and flux; Lorentz force on moving charge; Energy of and torque on a current loop in a magnetic field; Biot-Savart Law illustrated by magnetic fields of a straight wire and circular loop; forces between current-carrying straight wires; Ampere's Law in integral form.

Quantum Physics – 18 lectures

Origins of quantum physics. Photoelectric effect. Compton Effect. De Broglie's Postulate. The Uncertainty Principle. Black body radiation and specific heat. Atomic spectra. Bohr model of the atom. Correspondence Principle. Steady-state Schrödinger equation. Particle in a 1-D box. Finite potential well. Simple harmonic oscillator. Particle at potential step. Tunnelling through a barrier. Angular momentum and spin. Quantum theory of Hydrogen atom. The periodic table. Formation of chemical bonds. Quantum information.

Gravitation and Astrophysics – 12 lectures

Motion of the planets: early models of the solar system, Newton's law of gravitation, gravitational potential energy, motion of satellites, Kepler's laws and the motion of planets (derivation of the orbit equation, conservation of angular momentum, properties of the ellipse), apparent weight and the earth's rotation, escape velocity. Our solar system - the planets: physical properties, composition, terrestrial planets, gas giants. Extrasolar planets: detection methods. Observing the universe: refracting telescopes, reflecting telescopes, space telescopes, radio observations. The Sun: physical properties, solar interior, solar surface and atmosphere. Stars: constellations, magnitudes, distances, size of stars, the Hertzsprung-Russell Diagram, introduction to stellar evolution. Galaxies: the Milky Way, other galaxies, dark matter. Origin and evolution of the universe: the expansion of the universe, age of the universe, big bang models, cosmic microwave background.

Assessment	Weighting
Examination	60%
Laboratory Practical work	30%
Online assignments	10%

Note: There is a minimum mark requirement of 30% separately in the Examination component and the Laboratory component, in order for a Pass or Qualified Pass mark in the module to be granted. Other components making up fewer marks are not included in this requirement.

PYU22T10 Physics for Theoretical Physics

Semester 1 – lectures, practical laboratory, project, online assignments and tutorials – 10 credits
(G. Cross, H. Zhang, S. Dooley, M. Hegner)

This module combines elements of classical physics, as follows:

Thermodynamics – 15 lectures

Electricity and Magnetism II – 14 lectures

Materials – 12 lectures

Oscillations – 12 lectures

Learning Outcomes

On successful completion of this module, students should be able to:

- Solve basic problems in relation to harmonic oscillators
- Explain a broad variety of astrophysical phenomena with simple physics
- Describe elementary crystal structures and the response of materials to external forces
- Employ web-based research techniques in a small group project and present the results in the form of a poster
- Prepare a report detailing methodology, data gathering and interpretation of a physical experiment
- Describe how the laws of thermodynamics react to properties of matter
- Describe Maxwell's equations in the integral form and apply them to solve problems with simple electric and magnetic geometries.
- Relate the electromagnetic laws to the working principles of basic circuit elements and apply circuit laws and theorems to solve dc/ac circuits.

Syllabus

Thermodynamics – 15 lectures

Kinetic theory and the ideal gas equation. Van der Waals model for real gases. First law of thermodynamics. Internal energy, heat and work. Reversible and irreversible processes. Specific heat. Second law of thermodynamics. Heat engines, Carnot cycles. Entropy. Probability and disorder. Combined first and second laws. Central equation. H, F, G. Maxwell's relations. Energy equations. Cooling processes. Joule-Kelvin effect. Third law of thermodynamics.

Electricity and Magnetism II – 14 lectures

Magnetism, magnetic field lines and flux; Lorentz force on moving charge; Energy of and torque on a current loop in a magnetic field; magnetic fields of moving charges; Biot-Savart Law illustrated by magnetic fields of a straight wire and circular loop; forces between current-carrying straight wires; Ampere's Law in integral form illustrated by field of a straight conductor of finite thickness. Electromagnetic induction and Faraday's Law in integral form; Lenz's Law; induced electric fields and motional emf's; summary of Maxwell equations in integral form; Resistance, capacitance, mutual inductance and self-inductance; Nodal and mesh analysis, Thevenin theorem, R-C and R-L circuits, AC circuits, phasor diagrams, reactance, resonance, and complex representation of reactance. Power analysis.

Materials – 12 lectures

Inter- and intra- molecular forces, potential energy curves, heat capacity, thermal expansion and conductivity. Stress, strain, shear, elastic and plastic deformations of solids. Structures of solids in crystalline, glass, plastic phases. Insulators, conductors and semiconductors. Point defects and imperfections in solids – Iron/Carbon system. Density, pressure, surface tension, buoyancy and hydrodynamic-incompressible and compressible flows in fluids. Bernoulli's equation. Viscosity,

diffusion, laminar and turbulent flow. Gas laws, kinetic theory and collisions, PVT diagrams, thermal expansion. Conductive, convective and radiative transport of heat. Stefan-Boltzmann law.

Oscillations – 12 lectures

Review of simple harmonic motion. Forced and damped oscillations. Resonance. Two coupled oscillators, modes and normal coordinates. Many coupled oscillators. Transition to continuous systems. Waves. Nonlinear behaviour. Anharmonic behaviour.

Assessment	Weighting
Examination	60%
Experimental / Computational laboratories	25%
Project	5%
Online Assignments and Tutorials	10%

Note: There is a minimum mark requirement of 30% separately in the Examination component and the Laboratory component, in order for a Pass or Qualified Pass mark in the module to be granted. Other components making up fewer marks are not included in this requirement.

PYU22T20 Physics for Theoretical Physics

Semester 2 – lectures, practical laboratory, online assignments and tutorials – 10 credits
(J. Vos, M. Stamenova, E. Keane, D. McCloskey)

This module combines four elements of modern physics, as follows:

Chaos and Complexity – 12 lectures

Nuclear and Particle Physics – 14 lectures

Observing the Universe – 12 lectures

Waves and Optics II – 14 lectures

Learning Outcomes

On successful completion of this module, students should be able to:

- Describe how physics is underpinned by quantum and nuclear physics; waves and optics
- Explain the concepts of deterministic chaos and complexity in relation to dynamical systems
- Relate the concept of oscillations to optical properties of matter and AC circuits
- Prepare calculations and present in small groups
- Write and run Python programs to perform computer experiments

Syllabus

Chaos and Complexity – 12 lectures

Examples of chaotic systems, logistic map, period doubling, Feigenbaum numbers, Ljapunov exponent, phase portraits, iterated maps, fractals, self organised criticality, cellular automata, dynamics of pedestrian motion.

Nuclear and Particle Physics – 14 lectures

Models of the atom. Rutherford scattering. Scattering cross-section. Nuclear radius and density. Nuclear force. Nuclear binding. Nuclear masses. Mass defect. The Segrè chart. Nuclear models: the liquid drop model and the shell model. Mass dependence of binding energy per nucleon. Atomic mass parabola for isobars. Beta decay. Electron, positron emission. Electron capture. Alpha decay. Heavy element decay chains. Barrier penetration mechanism. Gamma decay. Radioactive decay law. Analysis of parent-daughter activity relationships. Specific activity. Radiometric dating. Harmful effects of radiation and dosimetry. Nuclear reactions. Nuclear fission. Fission products. Induced fission. Nuclear reactors. Neutron moderation. Control and delayed neutrons. Reactor types. Environmental and other concerns. Fuel cycle. Nuclear fusion. Fusion reactors. Fundamental particles and interactions. Positron discovery and the Dirac theory. Antiparticles. Neutrinos. Interaction mediating particles. Yukawa potential. Particle accelerators. Leptons and hadrons. Fermions and bosons. Particle reactions and conservation laws. Quarks and gluons. The Standard Model.

Astrophysics – 12 lectures

Continuous radiation of stars: flux, luminosity, magnitudes, colours. Spectral lines in stars: spectral classification, origin of spectral lines, the Hertzsprung-Russell diagram. Binary stars: Doppler effect in astronomy, stellar masses, mass-luminosity-radius relationship. Basic nucleosynthesis and stellar equilibrium. Life and death of stars: stellar evolution, end stages of stellar evolution, planetary nebulae, white dwarfs, supernovae, neutron stars and black holes. Interstellar medium. Star formation: gravitational collapse, initial mass function. Exoplanets and life in the Universe: planet formation, exoplanets detection and statistics, life in the universe. Galaxies and galaxy clusters: Milk Way, galactic rotation, dark matter, galaxy classification, distribution of galaxies, expansion of the Universe, galaxy clusters, active galaxies. Cosmology and the early Universe: gravitational lensing, cosmology, the evolution of the universe, dark energy, big bang theory.

Waves and Optics II – 14 lectures

Maxwell equations in differential form. Coulomb's and Gauss' Laws; Biot-Savart and Ampere's Laws; absence of magnetic monopoles; Faraday's Law and magnetic induction. Electric dipoles, dielectric polarisation and dielectric susceptibility; magnetic dipoles, magnetisation and diamagnetic susceptibility; continuity equation, displacement current and Maxwell's generalisation of Ampere's Law. Electromagnetic waves in vacuum and isotropic matter. Energy density in time-varying electromagnetic fields and Poynting vector. Reflection, refraction, plane, circular and elliptic polarisation of light; dichroism, birefringence; interference, interferometers, coherence, Young's slits, near and far field diffraction.

Assessment

	Weighting
Examination	60%
Experimental / Computational laboratories	30%
Online Assignments and Tutorials	10%

Note: There is a minimum mark requirement of 30% separately in the Examination component and the Laboratory component, in order for a Pass or Qualified Pass mark in the module to be granted. Other components making up fewer marks are not included in this requirement.

Overview

This module provides an in-depth view on the physics that govern how stars and galaxies evolve. The universe became a fundamentally different place when the first stars formed about 150 million years after the Big Bang. From this point on, new chemical elements were synthesized, photons were produced on massive scales by nuclear reactions in stars, and galaxies were assembled through collapse and mergers. We will cover the observational quantities that we can measure such as temperature, luminosity, and metallicity. We will derive the fundamental theory that explain the observations of stars and galaxies throughout the history of the universe.

Part I: Stellar Astrophysics

Part II: Galactic and Extragalactic Astrophysics

Learning Outcomes

On successful completion of this module, students should be able to:

- Describe the major stages in the evolution of a star from birth to death
- Explain the Hertzsprung-Russell diagram for stellar populations of different ages
- Manipulate the basic equations for stellar structure and evolution in order to derive elementary results for global stellar properties and timescales
- Derive the basic equations governing the dynamics of the Sun and nearby stars with respect to the Galaxy
- Explain the distribution of stars, gas and dust within galaxies, and describe the properties of the various types of galaxies found in the Universe
- Discuss the evidence for massive black holes at the centres of active galaxies and for Dark Matter in the Universe on a variety of scales

Syllabus

Part I: Stellar Astrophysics

Properties of radiation and their applications to stellar interiors: specific intensity, flux, luminosity, and effective temperature; Stellar opacities: sources, optical depth, Rosseland mean opacity; Stellar structure: hydrostatic equilibrium, mass conservation, equation of state, energy sources and transport; Stellar models: equations of stellar structure and boundary conditions; Stellar evolution: initial mass function, main sequence, hydrogen burning, advanced stages, low mass stellar evolution, high mass stellar evolution; Remnants and Compact Objects: white dwarfs, neutron stars, black holes; Physics of stars in binary systems.

Part II: Galactic and Extragalactic Astrophysics

The basic constituents of galaxies; the properties and dynamics of the Milky Way; the Local Group of galaxies; galaxy types, modern classification, and fundamental properties ; stellar distribution and dynamics in spiral and elliptical galaxies; methods for measuring distances, masses, and luminosities of galaxies, and their limitations; the Virial Theorem applied to galaxies; star-formation histories and chemical evolution of galaxies; dark matter on galactic and extragalactic scales; galaxy clusters; active galaxies and supermassive black holes

Assessment

	Weighting
Examination in Stellar & Galactic Structure	80%
Continuous Assessment in Stellar Astrophysics	10%
Continuous Assessment in Galactic and Extragalactic Astrophysics	10%

Overview

Imaging and spectroscopy across the full EM spectrum is the primary means for determining the properties and characteristics of astronomical objects. This module provides an introduction to instrumentation for a range of astrophysical investigations, focussing on the optical and radio portions of the spectrum. The basics of radiative transfer and its underlying micro and macro physics are introduced and the application to a number of specific practical problems is also covered. Examples of specific investigations using real-world examples and data are used.

Part I: Astrophysical Instrumentation

Part II: Astrophysical Spectroscopy

Learning Outcomes

On successful completion of this module, students should be able to:

- Give an overview of different types of telescopes and detection techniques appropriate for specific astronomical investigations, including their advantages and limitations
- Describe the processes that limit the angular resolution and sensitivity of telescopes both in terms of theoretical and also in atmospheric-limited cases and the techniques used to reduce their influence
- Be able to distinguish between thermodynamic equilibrium (TE), local thermodynamic equilibrium (LTE), & non-LTE, and how these apply in the case of stellar interiors and more generally
- Apply statistical mechanics knowledge to the solution of practical astrophysical problems, including the use of radiative transfer
- Be able to interpret the multi-dimensional stellar classification system with reference to the Saha and Boltzmann equations

Syllabus

Part I: Astrophysical Instrumentation Telescopes and optical instrumentation. Observational limitations – telescope aberrations and the effects of the atmosphere. Active and adaptive optics. New technology telescopes. Optical detection techniques. Optical interferometry. Basic concepts of radio astronomy. Receiver systems and detectors. Radio interferometry. Overview of different types of telescopes and detection techniques for other parts of the electromagnetic spectrum.

Part II: Astrophysical Spectroscopy Atomic populations and transitions: micro and macro physics, classical and quantum physics. Detailed balance and Einstein relations. Line Profiles. Radiation units. Radiation transfer. Plane-parallel models. Limb darkening. Saha equation. Stellar spectra.

Assessment

	Weighting
Examination in Astrophysical Spectroscopy and Astrophysical Instrumentation	80%
Continuous Assessment in Astrophysical Spectroscopy	10%
Continuous Assessment in Astrophysical Instrumentation	10%

Part I: Computational Laboratory – 12 experimental laboratory sessions (of 6 hours duration).

Part II: Communication Skills – 20 lectures/workshops

Part III: School Seminars – 8 seminars

Learning Outcomes

On successful completion of this module, students should be able to:

- Understand and develop Python code at an advanced level
- Employ computer-based data analysis of multi-dimensional datasets
- Use advanced statistical inference tools to extract information from astrophysical datasets
- Prepare an extended analytical report on an experiment
- Apply learned skills to tackle unseen computational astrophysics problems
- Write a précis of a research seminar
- Make a scientific presentation to an audience
- Create a personal CV

Syllabus Part I: Computational Laboratory – 12 experimental laboratory sessions (of 6 hours duration).

This module introduces computational Astrophysics to students using Python. The student will develop computational skills that can be further applied to theoretical, numerical and observational Astrophysical studies. The skills learned in this module are transferrable to other areas of studies, such as analytics of big data, data processing and imaging. The module will further equip students to carry out their final year research project in Year 4 of the degree. Multiple sessions are dedicated to introducing the use of python in astrophysics through a series of worksheets that students complete at their own pace, and following this the students will use these skills to complete astrophysics experiments. At the end of the module, the student will have learned: python commands and modules; how to create, modify and operate on large multi-dimensional arrays; to create plots and images; to perform advanced model fitting; to create numerical models of diverse astrophysical phenomena; to create their own procedures, functions, and classes; to read and save data in common formats; to control the flow of program execution. Students will cement their learning by conducting experiments that are designed to continue the development of computational skills and personal initiative and will be assessed based on 3 submitted reports. Experiments are subject to change but may include working with big datasets in supernova cosmology, fitting supernova light curves/galaxy spectra, modelling radial velocities of stars and transit light curves used for discovery and classification of exoplanet systems.

Part II: Communication Skills – 20 lectures/workshops Effective communication of scientific results and ideas as written reports and oral presentations. The structure of a scientific article. The role of graphics and diagrams. Style and vocabulary. Addressing an audience. Use of slides and overheads. Class members will give a short seminar to the entire JS lab group and write an essay on topical issues in physics. Introduction to risks, hazards and risk assessments.

Part III: School Seminars – 8 seminars – A broader introduction to cutting edge physics research will occur through attendance at School of Physics seminars.

PYU33AP4 Practical in Physics and Astrophysics – Experimental Laboratory (5 credits)

Semester 2 – 10 practical laboratories of 4 hours duration – 5 credits (L. Matrà, K. Maguire, B. Espey)

Learning Outcomes

On successful completion of this module, students should be able to:

- Operate advanced apparatus from manual instructions
- Maintain a laboratory notebook record
- Employ computer-based data analysis
- Apply appropriate error analysis
- Prepare an extended report on an experiment

Syllabus

Practical Laboratory – 10 experimental laboratory sessions (of 4 hours duration). An introduction to critical thinking in analysis of physical data. Advanced experiments ranging across multiple techniques requiring observations, physical measurements, data acquisition, data analysis, interpretation of physical phenomena and of quantitative results, verification of results, quantification of uncertainties, all of which are to be documented in laboratory notebooks. All experiments performed must be fully analysed, selected experiments will require an analytical report with appropriate experimental and theoretical background, analysis, conclusions, citations and bibliography.

PYU33AP5 Practical in Physics and Astrophysics

Semester 1 – 5 credits (N. Gibson, K. Maguire, J. Vos)

* For students on Study Abroad programmes in Semester 2 only

Part I: Practical /Computational Laboratory – 6 experimental laboratory sessions (of 6 hours duration) or equivalent self-directed virtual laboratory experiments.

Learning Outcomes

On successful completion of this module, students should be able to:

- Understand and develop Python code at an advanced level
- Employ computer-based data analysis of multi-dimensional datasets
- Use advanced statistical inference tools to extract information from astrophysical datasets
- Prepare an extended analytical report on an experiment
- Apply learned skills to tackle unseen computational astrophysics problems

Syllabus Part I: Practical/Computational Laboratory – 6 experimental laboratory sessions (of 6 hours duration) or equivalent self-directed virtual laboratory experiments. This module introduces lab Physics and/or computational Astrophysics to students using Python. The student will develop laboratory/computational skills that can be further applied to theoretical, numerical and observational Physics/Astrophysics studies. The module will further equip students to carry out their final year research project in Year 4 of the degree. Experiments are subject to change. Advanced lab experiments range across multiple techniques requiring observations, physical measurements, data acquisition, data analysis, interpretation of physical phenomena and of quantitative results, verification of results, quantification of uncertainties, all of which are to be documented in laboratory notebooks. Specificity astrophysics projects typically include working with big datasets in supernova cosmology, fitting supernova light curves/galaxy spectra, modelling radial velocities of stars and transit light curves used for discovery and classification of exoplanet systems.

Part I: Numerical Methods I

Part II: Computational Methods

Learning Outcomes

On successful completion of this module, students should be able to:

- Apply standard numerical methods to problems of differentiation, integration and data handling
- Compute numerical solutions to ordinary differential equations
- Critically assess the application of Monte Carlo methods to minimization problems
- Explain the concept of genetic algorithms
- Perform computational tasks in Python using both scripts and interactive notebooks
- Import and call relevant functions from a variety of scientific computing libraries
- Prepare publication quality figures from numerical data

Syllabus

Part I: Numerical Methods I

Numerical differentiation/integration, solving ordinary differential equations, random numbers, Monte Carlo methods, genetic algorithms and neural networks.

Part II: Computational Methods

Programming in Python: syntax, scripts, notebooks and data structures. Scientific libraries: importing external packages; common modules for arrays, numerics and plotting (Numpy, SciPy, Matplotlib). Applications to physical problems. Advanced topics.

Learning Outcomes

On successful completion of this module, students should be able to:

- Recognize the need to extend the concepts developed in classical Physics to account for what happens with matter at the atomic and sub-atomic levels
- Identify when a problem requires the use of quantum-mechanics concepts and when it can be solved by standard classical theories
- Operate with the mathematical structure of quantum mechanics, in particular, linear algebra and wave mechanics
- Solve basic problems of Quantum Mechanics with regards to how a quantum particle behaves under the action of a few simple force potentials
- Apply perturbation theory to describe more complex and realistic systems in terms of those simple force potentials

Syllabus

Mathematical foundations of quantum mechanics: description of quantum states and dynamical variables, eigenvalue equations, superposition principle, expectation values. Solution of Schrödinger equation for 1-dimensional systems: SHO using ladder operators, Kronig-Penney model. Angular momentum: calculation of spectrum using ladder operators, orbital angular momentum and parity, spin. Solution of Schrödinger equation in 3 dimensions: the hydrogen spectrum. Time independent perturbation theory.

Part I: Electromagnetic Theory

Part II: Quantum Optics & Lasers

Learning Outcomes

On successful completion of this module, students should be able to:

- Connect Maxwell's Equations with the equivalent experimental laws
- Distinguish between polar and non-polar electric media and, by analogy, the different magnetic media
- Apply Maxwell's Equations to the prediction of electromagnetic waves
- Explain when classical optics gives way to quantum optics
- Describe the operation of a laser in terms of population inversion and optical feedback
- Distinguish between spontaneous and stimulated emission, coherent and incoherent radiation, longitudinal mode and transverse modes
- Connect the laser properties of coherence and high brightness with applications in research, materials processing and communication

Syllabus

Part I: Electromagnetic Theory

Vector operators, Divergence and Stokes' theorems; Coulomb's and Gauss' Laws; dipoles and polarisation; electric susceptibility and displacement vector; polar dielectrics and Langevin analysis; potential and electric energy density; electrostatic boundary conditions and method of images; Biot-Savart and Ampere's Laws; magnetic dipole and magnetisation; H vector; vector potential; magnetic energy density; magnetostatic boundary conditions; dia, para and ferro magnetism; Faraday's law of electromagnetic induction; magnetoelectric induction; Maxwell's equations; plane waves; Poynting vector.

Part II: Quantum Optics & Lasers

Interaction of light with matter: black body radiation, the photoelectric effect, Einstein A and B coefficients. Light as photons. Coherence and fluctuations of real sources, correlation functions, photon statistics. Behaviour of photons in beam splitters, interferometers and cavities. The Raman effect. Basic laser theory: absorption and gain cross-section, saturation of absorption and gain, cavity lifetime and longitudinal modes, transverse mode structure, Gaussian beams. Three and four level lasers and power output in continuous wave lasers. Transient laser behaviour, relaxation oscillations, Q-switching, methods of Q-switching, mode-locking and methods of mode-locking. Specific laser systems: ruby and Nd-YAG/glass lasers, He-Ne laser, argon-ion laser, carbon-dioxide laser, excimer laser, dye laser and semiconductor diode laser.

Assessment

Weighting

100%

Learning Outcomes

On successful completion of this module, students should be able to:

- Describe crystal structure in terms of translational and rotational symmetry, conventional unit cell, and Miller indices
- Demonstrate the relationship between direct lattice and reciprocal lattice
- Calculate crystal structure parameters from experimental X-ray diffraction data
- Describe the main characteristics of the vibrational dispersion curves and the electronic band structure of crystalline metals, semiconductors and insulators
- Apply the free electron and nearly free electron models to the quantitative analysis of the transport properties of real metals
- Provide a quantitative interpretation of the heat capacity of insulators and metals, including temperature dependence
- Develop understanding of the effective mass of the current carriers and its relation to the energy-momentum dispersion curves.
- Develop a qualitative understanding of the electron-electron scattering processes.
- Become familiar with the different types of magnetic order: ferromagnetic and antiferromagnetic order, develop understanding of the factors defining the type of the magnetic order.
- Develop understanding of behaviour of ferromagnetic materials placed in a magnetic field.

Syllabus

Crystal systems, Bravais lattices, unit cell parameters, translational and rotational symmetry elements, point groups, space groups, Miller indices. The reciprocal lattice. X-ray and neutron scattering. Laue condition, Bragg's Law and their equivalence. Ewald construction for X-ray diffraction. X-ray diffraction patterns and their interpretation. Geometrical structure factor and atomic form factor.

Crystal defects. Point defects. One-dimensional defects: dislocations. Energetics and thermodynamics of defects. Equilibrium density of point defects.

Stress and strain in matrix form in the case of isotropic materials, Poisson ratio, stress and strain in non-isotropic materials. Stiffness and compliance matrixes for materials for different crystal systems.

Acoustic waves in isotropic media, longitudinal and transversal modes. Counting vibrational states in the case of standing waves in periodic systems, density of states in k-space, Debye frequency.

Counting vibrational states in the case of running waves, Born Von Karman boundary condition.

Deriving vibrational states in the case of a 1D crystal model with identical atoms, significance of the first Brillouin zone. Derivation of the dispersion curve in the case of a 1D crystal model with two different sets of atoms, derivation of the acoustic and optics modes. Phonon dispersion curves in real 3D crystals. Phonon as a quasiparticle, its similarity with and difference from a real particle. Derivation of heat capacity dependencies arising from phonons.

Electrons as a gas, Fermi function, definition of the Fermi energy. Electronic heat capacity. Derivation of the energy bands in the 1D case of a nearly free electron model. Presentation of energy bands in reduced-, extended- and repeated zone schemes. Bloch functions and theorem.

Definition of electrons and holes from the point of view of the Fermi surface. Electrical conductivity, dynamics of electrons in crystalline solids, effective mass for electrons and holes and its definition from the dispersion curves, electron-electron scattering, mean free path, electron- and hole dynamics in the presence of magnetic field. Magnetic order, magnetic moment, H-field and B-field in the case of ferromagnetic materials, demagnetising field. Magnetism of electrons, spin-orbit coupling.

Electron-spin resonance in paramagnetic materials and ferromagnetic resonance.

Part I: Physics of Semiconductors

Part II: Semiconductor Devices

Learning Outcomes

On successful completion of this module, students should be able to:

- Describe the basic behaviour of semiconductors in terms of doping and carrier concentrations
- Calculate the dynamic behaviour of semiconductors in terms of drift, diffusion, generation, recombination and the consequences of inhomogeneous doping
- Describe in detail the physics of bipolar and unipolar homojunction and heterojunction semiconductor devices.
- Evaluate and predict through analytical calculations the performance of such devices, i. e. their input, output and/or their transfer characteristics
- Discuss the semiconductors for consumer products and the information revolution

Syllabus

Part I: Physics of Semiconductors

Introduction to semiconductors. Charge carrier densities and Fermi level. Intrinsic and extrinsic conductivity, doping with impurities. Carrier transport: drift, mobility, diffusion. Motion in magnetic fields: Hall effect and Cyclotron Resonance. Optical processes, optical absorption. Generation and recombination, minority carrier lifetime, photoconductivity. Non-equilibrium transport of charge carriers, the continuity equation. Inhomogeneous doping.

Part II: Semiconductor Devices

Construction techniques for devices. The planar process. The pn junction diode: depletion layer, built-in potential, electric field, current flow. Uses of diodes. Bipolar transistors. MOSFETs, LEDs and compound semiconductor devices, including Gunn devices, Esaki diodes and high-performance heterojunction transistors.

Part I: Electronics

Part II: Instrumentation

Learning Outcomes

On successful completion of this module, students should be able to:

- Design basic circuits' power supply, communications and computer-interfacing
- Apply bandwidth-narrowing techniques to improve the signal-to-noise ratio in measurements
- Select imaging detectors for a given application, with regard to resolution, sensitivity and wavelength
- Distinguish between the different forms of scanning probe microscope (SPM) and discriminate between real SPM image features and image artefacts
- Describe the principles of optical tweezers (OT) and choose the appropriate light source for OT applications in life-science experiments
- Extend the diagnostic application of cantilever array technology into the wider fields of physics, chemistry and life science

Syllabus

Part I: Electronics

Electronic components. Power supplies. Computers and interfacing. Sensors and transducers. Control systems. Noise in electronic systems.

Part II: Instrumentation

Scanning Probe Microscopes (Scanning Tunneling Microscopy, Scanning Force Microscope, Scanning Nearfield Optical Microscope); Sensors (tunnelling current, force, optical, capacitance, piezoresistance); Motion (piezo electrics, stepper motors, etc.); Environments (UHV, Ambient, liquid, high temperature); Detectors for visible light: position sensitive detectors, photomultipliers, avalanche photodiodes, solid state junction detectors; Software interface (e.g. LabVIEW); Feedback electronics; Multiplexing; Optical tweezers; Cantilever Array devices; Functionalization strategies, description of current research.

Overview

From individual multi-electron atoms, electron interactions within the atom, and the resultant electronic structure of the atom, to ensembles of particles and their collective behaviour, this module provides a foundational overview of complex quantum behaviours and interactions.

Part I: Statistical Thermodynamics

Part II: Atomic Physics

Learning Outcomes

On successful completion of this module, students should be able to:

- Describe the gross and fine structure of single-electron atoms in light of the semi-classical Bohr and quantum mechanical Schrödinger models
- Apply the laws of quantum mechanics to multi-electron atoms, taking into account the effects of angular momentum
- Explain molecular spectra in terms of vibrational, rotational and electronic transitions
- Outline the basic concepts of equilibrium statistical thermodynamics
- Describe mathematically the behaviour of physical systems governed by Fermi-Dirac, Bose-Einstein and Maxwell-Boltzmann statistics
- Determine the partition functions of simple quantum systems

Syllabus Part I: Statistical Thermodynamics

The purpose of this course is to introduce Statistical Thermodynamics, which provides a microscopic understanding of the macroscopic thermodynamic properties of materials. A simple assumption of equal statistical weights allows the properties of individual quantum particles to be combined together properly to calculate macroscopic thermodynamic quantities, which can be compared with experiment. Topics covered (1) Counting states in classical and quantum systems (2) Fundamental assumption of statistical physics; ensembles (3) Model system of 2-state components (4) Two systems in equilibrium: entropy, temperature and chemical potential (5) Partition functions and their relation to thermodynamic quantities (6) Third Law of Thermodynamics (7) Fermi-Dirac and Bose-Einstein Statistics (8) Quasi-classical statistics: equipartition of energy (9) Application of quantum statistics to photons, gases, and solids.

Part II: Atomic and Molecular Spectroscopy

One-electron and multi-electron atoms, orbital and spin angular momentum, shell structure, Aufbau principle, electric and magnetic moments, spin-orbit coupling and fine structure, Lamb shift, addition of angular momenta, term symbols, electric dipole and quadrupole and magnetic dipole selection rules, atomic energy levels and spectroscopies in electric and magnetic fields, linewidths, chemical binding in molecules, rotational, vibrational and electronic spectroscopies of molecules, traps, condensates and 'slow light'.

PYU33PP3 Practical in Physics

Semester 1 and Semester 2 – 10 credits (B. Espey, G. Cross, C. McGuinness, M. Möbius)

Part I: Practical Laboratory – 11 experimental laboratory sessions (of 6 hours duration).

Part II: Communication Skills – 20 lectures/workshops

Part III: School Seminars – 8 seminars

Learning Outcomes

On successful completion of this module, students should be able to:

- Operate advanced apparatus from manual instruction
- Maintain a laboratory notebook record
- Employ computer-based data analysis
- Apply appropriate error analysis
- Prepare an extended report on an experiment
- Write a précis of a research seminar
- Make a scientific presentation to an audience
- Create a personal CV

Syllabus

Part I: Practical Laboratory – 11 experimental laboratory sessions (of 6 hours duration). An introduction to critical thinking in analysis of physical data. Advanced experiments ranging across multiple techniques requiring observations, physical measurements, data acquisition, data analysis, interpretation of physical phenomena and of quantitative results, verification of results, quantification of uncertainties, all of which are to be documented in laboratory notebooks. All experiments performed must be fully analysed, selected experiments will require an analytical report with appropriate experimental and theoretical background, analysis, conclusions, citations and bibliography.

Part II: Communication Skills – 20 lectures/workshops Effective communication of scientific results and ideas as written reports and oral presentations. The structure of a scientific article. The role of graphics and diagrams. Style and vocabulary. Addressing an audience. Use of slides and overheads. Class members will give a short seminar to the entire JS lab group and write an essay on topical issues in physics. Introduction to risks, hazards and risk assessments.

Part III: School Seminars – 8 seminars – A broader introduction to cutting edge physics research will occur through attendance at School of Physics seminars.

Practical Laboratory – 8 experimental laboratory sessions (of 6 hours duration).

Learning Outcomes

On successful completion of this module, students should be able to:

- Operate advanced apparatus from manual instruction
- Maintain a laboratory notebook record
- Employ computer-based data analysis
- Apply appropriate error analysis
- Prepare an extended report on an experiment
- Perform a range of complex non-linear data fitting
- Use physics simulation software or design data acquisition software

Syllabus

Practical Laboratory – 8 experimental laboratory sessions (of 6 hours duration). A continuation of advanced experiments ranging across multiple techniques requiring observations, physical measurements, data acquisition, data analysis, interpretation of physical phenomena and of quantitative results, verification of results, quantification of uncertainties, all of which are to be documented in laboratory notebooks. All experiments performed must be fully analysed, selected experiments will require an analytical report with appropriate experimental and theoretical background, analysis, conclusions, citations and bibliography.

In addition, an introduction to non-linear curve fitting and multivariate analysis of complex data and/or large data sets. Further choice in the introductions to simulation software applied to physics problems or of developing data acquisition software and strategies for interfacing and control of experiments.

Learning Outcomes

On successful completion of this module, students should be able to:

- Describe the observed properties of the solar system
- Estimate the initial mass of the solar system using solar nebula theory
- Explain in detail the main solar system formation theories
- Derive the equations responsible for the stability of planetary atmospheres and magnetospheres
- Explain the physics of the Sun and solar wind
- Explain the main exoplanet detection techniques and the physical information we derive from these observations
- Achieve the learning outcomes of the Cosmology module PYU44A05

Syllabus

Part I: Planetary and Space Science

This course starts with a detailed review of the solar interior and energy transport mechanisms in the radiative and convection zone. The solar atmosphere is then discussed, focusing on the physics of the photosphere, chromosphere, transition region and corona. A detailed derivation of Parker's theories of the solar wind and interplanetary magnetic field is given. Finally, we focus on the interaction of the solar wind with planetary magnetospheres and other objects in the solar system. Formation of our solar system, denizens of our solar system, discovery of extra-solar planets and planetary systems.

Part II: Cosmology

The syllabus for this part of the course is given in the following entry for Cosmology PYU44A05.

Proposed Assessment

Weighting

Examination in Planetary and Space Science	35%
Examination in Cosmology	35%
Continuous Assessment in Planetary and Space Science	15%
Continuous Assessment in Cosmology	15%

Learning Outcomes

On successful completion of this course, students will be able to:

- Appreciate the background to the topic from basic observational results through to more refined studies of the recent past, including the relative youth of physical cosmology.
- Be able to explain the basic concepts of the subject and the basic assumptions made regarding our non-unique place and time in the Universe.
- Derive the basic equations describing the equation of state of matter, radiation, and dark energy, and their evolution in time and to itemise and critically analyse the evidence in favour of the Big Bang.
- Explain how recent observations of distance and velocity of distant objects have led to conflict with previously-held models, and how these models have had to be altered to accommodate these observations.
- Critically evaluate the current best-fit models and provide evidence for/against open and closed universes and the importance of dark matter and dark energy in the evolution of our Universe.
- Be able to place cosmology in the context of on-going developments both on very large and very small scales and to summarise the results expected in the near future.

Syllabus

Starting with basic cosmological observations and the basic postulates of the Cosmological Principle, this course derives far-reaching results using information from Newtonian principles. The implications of the most recent results concerning Dark Matter and Dark Energy are also discussed, together with possible future observational and research directions. The connection and derivation of similar results from the application of GR will also be discussed. On completion of the course, students will have an understanding of the basic properties of the Universe, how they have been derived from observational and theoretical approaches, and an appreciation for the youth of the field, and recent and future developments e.g. in the fields of dark energy, dark matter, etc.

Part I: High Performance Computing

Part II: Numerical Methods

Learning Outcomes

On successful completion of this module, students should be able to:

- Be able to formulate and solve physical problems which require linear algebra techniques
- Be familiar with scientific computing libraries such as SciPy and Gnu Scientific Library
- Be familiar with Fourier methods for signal processing.
- Be able to solve partial differential equations numerically using finite difference methods.
- Be able to implement these methods in Python.

Syllabus

Part I:

Introduction to scientific computing libraries (Gnu Scientific Libray, LAPACK, SciPy), Review of vector spaces and linear algebra, Solution of systems of linear equations, Eigenvalue and eigenvector problems, Matrix decompositions (LU, Cholesky, QR, SVD), Python labs to illustrate algorithms using physical examples.

Part II: Numerical Methods

Review of Fourier series and transforms, Correlation and convolution in Fourier space, Aliasing and spectral leakage in FFT, Signal filtering, Windowing, Solving PDE's analytically and numerically using finite difference methods, Numerical stability and accuracy of finite difference methods, Python labs to implement algorithms discussed in the course.

Overview

This module gives a comprehensive introduction to Nanoscience and the foundations of Polymer physics and Complex Fluids in general.

Part I: Nanoscience

Part II: Complex Fluids

Part III: Polymers

Learning Outcomes

On successful completion of this module, students should be able to:

- Demonstrate knowledge of the structure and properties of nanoscale systems, i.e. those with reduced size in one, two and three dimensions
- Use mathematical and physical models to describe the properties of such systems and make predictions about their behaviour
- Describe the outcome of simple experiments involving nanoscale systems and use physical models to interpret the data
- Draw comparisons and find commonalities between various types of nanomaterials and generalize as to how their structure determines their properties
- Describe the structure and properties of polymer chains and of polymers in liquid and solid environments
- Use mathematical and physical models to describe the properties of polymers and make predictions about their behaviour
- Describe the outcome of simple experiments and use physical models to interpret the data
- Demonstrate basic knowledge of fluid dynamics and ability to predict the flow in standard geometries for both Newtonian and non-Newtonian fluids.
- Be able to interpret rheological data for various colloidal suspensions and relate it to physical models that describe the flow behaviour of complex fluids
- Be able to describe and predict the various interparticle forces in colloidal suspensions, the mesoscopic structure these particles can form, and how both the forces and structure relate to the flow properties of these suspensions.

Syllabus

Part I: Nanoscience

Introduction to nanoscience; what is nanoscience, debunking nanomyths, classical size scaling, intermolecular interactions, DOS and dimensionality, Moore's law – Fabrication and analysis at the nanoscale; thin film fabrication, lithography and etching, colloids, microscopy, spectroscopy – 0D nanostructures; nanoparticles, structure, electronic properties, semiconducting nanoparticles, molecular nanostructures – 1D nanostructures; nanotubes, electronic properties in 1D, transport, applications – 2D nanostructures; quantum wells, graphene – Nanotechnology; nanomachines, the future.

Part II: Soft Matter

Introduction: What are complex fluids? Review of hydrodynamics and stress tensor. Origin of viscosity, Stokes drag, diffusion and Stokes-Einstein relation. Colloidal suspensions: Relevant forces between colloidal particles and stability. Rheology of complex fluids: Yield stress, shear thinning, shear thickening. Basic rheology models.

Part III: Polymers

Introduction to polymeric materials- molecular structure and architecture; Interactions between polymers and their surroundings -Energy and entropy; Polymer Chains- conformations of ideal and real chains, chain size; Dynamics- Rouse and Zimm models, reptation, viscosity; Polymers in solid state – Crystallinity, the glass transition, classes of solid polymer; Physical properties of polymers- mechanics, viscoelasticity, stress relaxation/creep, temperature dependence; High performance polymers- rigid rod polymers, spider silk, nanotubes.

PYU44NP2 Nanoscience Research Project

Semester 1, Semester2 – 20 credits

This module comprises a 9-week full-time research project conducted in either the School of Physics, the School of Chemistry, CRANN or an internationally recognised research laboratory that specialises in aspects of nanoscience, advanced materials or semiconductor processing.

Learning Outcomes

On successful completion of this module, students should be able to:

- Carry out an open-ended research project through all of its stages: literature study, data collection and data analysis
- Generate a concise research report
- Summarize in poster format the outcomes of a research project
- Make an oral presentation to an audience of peers

Assessment

PYU44NP5 Problem Solving in Nanoscience

Semester 1– 5 credits

This module develops general problem-solving and scientific comprehension in nanoscience, advanced materials or semiconductor processing. Students attend 9 tutorials and a selection of seminars in both the Schools of Chemistry and Physics which are related to nanoscience, materials chemistry, materials physics or related areas.

Learning Outcomes

On successful completion of this module, students should be able to:

- Participate in group discussion of problem-solving in physics
- Perform calculations that integrate disparate elements of physics

Assessment

Examination in comprehension and problem solving

Weighting

100%

Overview

The quantum mechanics part of this module exposes the fundamental principles of quantum mechanics, including Hilbert space, measurement, and time evolution. It looks at applications of these principles in time-dependent and scattering problems, the role of symmetry and angular momentum, and explores how many-particle systems can be treated. The nuclear physics part includes the strong nuclear force, nuclear structure and models, and decays and reactions. The high energy physics part introduces high energy physics theory and experiment, fundamental particles, the fundamental forces, and the Standard Model.

Part I: Advanced Quantum Mechanics

Part II: Nuclear Structure

Part III: High Energy Physics

Learning Outcomes

On successful completion of this module, students should be able to:

- Apply the fundamental principles of quantum mechanics to solve problems relating to the dynamics and observation of quantum systems.
- Use time-dependent perturbation theory to analyze dynamics and scattering problems, in systems with discrete and continuous spectra.
- Discuss and apply the properties of angular momentum, and its relationship to rotational symmetry.
- Describe and obtain through calculation the spin dynamics of single particles in time-dependent electromagnetic fields
- Construct wavefunctions for many-body systems of bosons and fermions, and analyze the physical consequences of particle identity and exchange.
- Describe the role of symmetry in quantum mechanics. Use symmetry arguments to determine wavefunctions and energy spectra, and analyze transition probabilities.
- Achieve the learning outcomes of the Nuclear Structure and High Energy Physics module PYU44P12.

Syllabus

Part I: Advanced Quantum Mechanics

State vectors, operators, and measurements. Relation between state vector and wavefunction formalisms. Time evolution in the Schrodinger and Heisenberg picture. Time-dependent perturbation theory and Fermi's golden rule. Scattering theory and the Born approximation. Angular momentum, rotational symmetry. Spin. Dynamics of spin in static and time-varying fields. Wavefunctions for many particles, exchange symmetry, bosons and fermions. Addition of angular momentum. Role of symmetry.

Part II: Nuclear Structure

The syllabus for this part of the course is given in the following entry for Nuclear Structure and High-Energy Physics PYU44P12.

Part III: High Energy Physics

The syllabus for this part of the course is given in the following entry for Nuclear Structure and High-Energy Physics PYU44P12.

Assessment

Overview

This module describes nuclear physics, nuclear structure and models, the strong nuclear force and nuclear decays and reactions. It introduces high energy physics theory and experiment, fundamental particles, the fundamental forces, and the Standard Model.

Part I: Nuclear Structure

Part II: High Energy Physics

Learning Outcomes

On successful completion of this module, students should be able to:

- Describe how the atomic nucleus is structured, reacts and decays.
- Perform analytical calculations associated with the structure of the nucleus.
- Deduce level structures and decay schemes from experimental evidence
- Define the properties of fundamental particles of the Standard Model; the fundamental forces, strong and electroweak, their interactions and the applicable fundamental conservation laws.
- Express the relativistic mechanics for analysis of experimental high energy physics interactions; use this knowledge to analyse simple two body collisions and formulate an appropriate model for the observed collision.
- Discuss quark and lepton mixing, e.g. CKM matrix; and how this is observed in experiments; in e-e+ collisions; in neutrino oscillations; and in CP violation leading to matter-antimatter asymmetries.
- Sketch or appraise a Feynman diagram distinguishing between the differing interaction vertices and the gauge bosons involved; giving estimates of the probability of the process and of the most likely higher order contributions.

Syllabus

Part I: Nuclear Structure

Strong and electromagnetic forces and the nuclear potential. Conservation laws, including those for parity and symmetry. Nuclear sizes and their measurement. Nuclear electromagnetic moments. Nuclear models, including liquid drop, shell, collective and cluster effects. Gamma decay, internal conversion. Beta decay, the Fermi theory. Nuclear reactions.

Part II: High Energy Physics

An introduction to the theory of fundamental particles and their interactions. Quantum numbers, conservation laws, exchange interactions and Feynman diagrams, applied to strong, weak and electromagnetic Standard model interactions. The quark model and resonant states including charmonium and bottomium. Quantum electrodynamics (QED) and quantum chromodynamics (QCD). Electron-positron and p-p physics at LEP and LHC. W and Z mesons, neutrinos and electroweak mixing. Quark mixing. Standard Model and Higgs boson. Beyond the Standard model.

Assessment

Examination in Nuclear Structure and High Energy Physics

Weighting

100%

Learning Outcomes

On successful completion of this module, students should be able to:

- Describe magnetism in solids in terms of the angular momentum of the electrons, distinguishing between the spin and orbital contributions.
- Calculate the ground-state terms of free ions from Hund's rules and their Curie-law susceptibility.
- Describe the characteristic physical properties of a ferromagnet, including heat capacity and domain structure.
- Describe the characteristic physical properties of a superconductor (zero resistance, Meissner effect, absence of electronic heat capacity, isotope effect).
- Relate the physical properties to underlying theoretical concepts, especially the energy gap, electron pairing and the two characteristic lengths.
- Manipulate the Ginzburg-Landau expression for the free energy to reproduce the phase transition.
- Integrate the elements of module material to yield an appreciation of potential applications of superconductivity physics in a range of electronic devices.

Syllabus

Part 1: Magnetism and Magnetic Properties

In these lectures we present the quantum theory and properties of paramagnetic ions, treat ferromagnetic order in the molecular field approximation, and provide an introduction to hysteresis and micromagnetism. Topics include: Units in magnetism, spin and orbital moments of the electron, atomic magnetism of single and multi-electron atoms, spin-orbit coupling, Landé g-factor, Zeeman splitting, vector model of the atom. Paramagnetism – classical Langevin theory, quantum theory for $S = 1/2$ and general spin (Brillouin theory). Curie law. Ferromagnetism-Weiss molecular field theory. Curie temperature, Curie-Weiss law. Origin of ferromagnetism. Heisenberg Hamiltonian. Positive and negative exchange. Demagnetising field. Ferromagnetic domains; hysteresis and coercivity. Magneto-crystalline anisotropy. Stoner-Wohlfarth model. Permanent magnets. Superexchange, molecular field theory of antiferromagnetism. Ferrites. Applications. Analogies with dielectric properties of solids.

Part II: Metal Physics and Superconductivity

This course provides a basic account of the phenomena and theory of superconductivity, and its applications including high- T_c oxide superconductors. Resistivity of normal metals: impurity scattering, temperature dependence of resistivity due to electron-phonon scattering. Superconductivity: zero resistance, Meissner effect, thermodynamic treatment of the phase transition. Energy gap from specific heat and tunnelling. Type I and II superconductors. Phenomenological Ginzburg-Landau theory. Penetration depth. Cooper pairs. Correlation length. Results of BCS theory Flux quantization, tunnelling, ac and dc Josephson effects.

Part I: Electromagnetic Theory

Part II: Optical Properties of Materials

Learning Outcomes

On successful completion of this module, students should be able to:

- Demonstrate knowledge of the foundations and meaning of the Maxwell equations, and of their wave-like solutions using elementary differential operators and their vector relations (gradient, divergence, curl)
- Solve problems involving both the electromagnetic fields and their scalar and vector potentials, including the significance of Gauge invariance
- Derive elementary optics relations (such as Snell's law) as a consequence of electromagnetism theory and its boundary conditions
- Demonstrate a basic knowledge of the classical theory of light propagation in solid materials, together with a knowledge of the quantum theory of absorption and emission in solids
- Interpret the measured optical spectra of solid materials
- Perform calculations of optical properties of solids

Syllabus

Part I: Electromagnetic Theory

A continuation of the JS electromagnetic theory course, with emphasis on electromagnetic waves. Maxwell's equations and the electromagnetic potentials, EM waves. Plane monochromatic EM waves in unbounded media: (a) vacuum or insulator, (b) ohmic conductor, skin effect. Electromagnetic energy, Poynting's vector. Reflection and refraction of EM waves at a plane boundary. Bounded em waves: waveguides. EM radiation due to an oscillating electric dipole.

Part II: Optical Properties of Materials

Basic concepts: second and third order nonlinear processes and susceptibilities. Materials and microscopic origins of nonlinearity.

Applications.

Assessment

Part I: Nonlinear Optics

Part II: Optical Communications

Learning Outcomes

On successful completion of this module, students should be able to:

- Perform calculations to determine material characteristic parameters and experimental design for wavelength conversion, pulse measurement by autocorrelation, four-wave-mixing and z-scan techniques
- Select materials for nonlinear optical applications based on an understanding of their material properties, especially their birefringent properties and non-linear refractive index.
- Describe nonlinear processes such as second harmonic generation, electro-optic effects, four-wave-mixing, self-phase modulation and optical phase conjugation.
- Discuss the physical principles of lasing, light guiding and detection in communications systems
- Explain the basic structure of the optical components in communications systems
- Solve simple numerical problems based on communications devices

Syllabus

Part 1: Nonlinear Optics

Basic concepts: second and third order nonlinear processes and susceptibilities. Materials and microscopic origins of nonlinearity. Applications.

Part II: Optical Communications

Waveguiding in planar waveguides and optical fibres, dispersion and loss in fibres. Semiconductor laser/LEDs and detectors. Optical fibre communications systems including digital modulation, noise and fundamental limits.

Assessment

Examination

Weighting

Learning Outcomes

On successful completion of this module, students should:

(1) Have an understanding of quantum plasmonics:

- Fundamentals of photonics of metallic and dielectric nanostructures up to extreme nanoscales
- Understand localized plasmons and surface plasmon polaritons
- Be familiar with nanoplasmonic open cavities
- Appreciate the foundations and opportunities of quantum plasmonics
- Have an insight into the physics of quantum emitters in nanoplasmonics
- Have an overview of applications of nanoplasmonics in quantum sensing and for quantum photonics

(2) Have an insight into the physics of metamaterials:

- Metamaterials concept: function from structure
- Have an understanding of the optics of materials with near-zero and negative refractive index
- Know how to achieve a material with near-zero and negative refractive index
- Understand the function of perfect lenses, optical cloaking, superlenses
- Appreciate slow light and trapped rainbows
- Understand active metamaterials

Syllabus

Introduction

A. Fundamentals of Quantum Plasmonics:

- Surface Plasmons (plasma oscillations, ponderomotive force, screening, surface plasmon polaritons at plane interfaces, surface plasmon nano-optics)
- Nanoplasmonic Cavities (characteristic geometries, quasi-normal mode theory)
- Quantum Emitters in Nanoplasmonic Cavities (quantum emitters, weak and strong coupling, density matrix theory, plasmonic spatio-temporal dynamics)

B. Physics of Metamaterials:

- Near-zero and Negative Refractive Index Optics (permittivities, permeabilities, perfect lens, trapped rainbow, radiative rates, reversal of Doppler and Cerenkov effects)
- Materials for Negative and Near-Zero Index (negative permittivity, negative permeability, transmission line metamaterials)
- Hyperbolic and Chiral Metamaterials
- Active Metamaterials (gain-enhanced nanoplasmonic metamaterials, metamaterial EIT, thermal meta-emitters)

Overview

This module gives a comprehensive introduction to science underpinning energy technologies with the emphasis on fundamental physics and materials science defining the concepts of modern energy generation and their technical limitations. The module will discuss current “bread and butter” technologies based on steam turbines providing the bulk of world-wide electricity generation at present. The module will include analysis of nuclear fission reactors that also provide a sizeable fraction of the world’s electricity. It will deal with renewable technologies such as solar photovoltaics whose share in the total energy production is set to increase with the drive to move away from the fossil fuels. Finally, we shall discuss the fundamental physics of nuclear fusion that may open an unlimited supply of fossil-free energy in the future and the challenges to overcome for this.

Learning Outcomes

On successful completion of this module, students should be able to:

- Identify the different forms of energy production available and their merits and disadvantages
- Understand the fundamental similarities between the mainstream forms of electricity generation based on converting heat into work where the heat source is either gas or oil or coal or nuclear fission
- Understand the fundamental limitations of the current main stream energy generation based on steam turbines resulting from the first principles of thermodynamics
- Explain the fundamental physics underpinning the architecture of the nuclear fission reactor.
- Explain the fundamentals of energy production by solar photovoltaics cells and the fundamental limitations of this technology
- Contrast different forms of renewable energies potentially available on the planet, including the technical limitations to their widespread use
- Contrast the carbon penalty associated with different forms of energy production
- Explain the fundamental challenges that need to be overcome in the quest towards nuclear fusion.

Syllabus

Global consumption of energy. Where the energy is expended and how much of it we need to sustain our life style. Sources of energy. Where can we get the energy and how much. Carbon emission. Can the carbon damage be reversed? Renewable energy sources, challenges and options. Brief overview of the fundamentals of thermodynamics. Maxwell relations, entropy of the ideal gas, Carnot theorem.

Steam phase diagram presented in axes of different variables.

The two mainstream energy producing conventional devices: steam turbine and combustion engine. Why they are still so important. Energy efficiency of the steam turbine considered from the first principles of physics and its fundamental limitations. Mollier Chart. Rankine cycle and the cycle with superheating. Work ratio and its significance for the cycle efficiency. Joule-Brayton cycle.

Structure of a nucleus, Yukawa potential. Nuclear fission. Thermalisation of neutrons. Suitable moderator material. Suitable isotopes for nuclear fission. Parameters defining burn rate of nuclear fuel. Parameters defining geometrical shape of the nuclear fuel. Methods of introducing time delay in the flux of neutrons for the reactor control. Main types of water-cooled nuclear reactors.

Nuclear fusion. Fuel for nuclear fusion. Energy break-even and the Lawson criterion. Magnetic confinement fusion, TOKAMAK, pinch effect in fusion plasma, theta-pinch and z-pinch. Stellarator. Inertial confinement fusion. Catalysed fusion reactions by Weizsacker and Bethe.

Fundamentals of photon statistics and its derivation from the Fermi function. Planck’s law. Stefan-Boltzmann law. Kirchhoff’s law. Temperature of the Sun’s surface.

Physics and structure of a semiconductor diode. $I(V)$ equation of a diode. Derivation of equations of transport phenomena in a p-n junction. Solar photovoltaic cell as a diode. $I(V)$ characteristics of a diode with- and without illumination. Fill factor. Temperature effects in solar cells and their quantification. Equivalent circuit of a solar cell. Shockley-Queisser limit. Advanced solar cells, tandem solar cells. Energy payback of a solar cell. Solar cells that are not based on silicon.

Production of electricity from solar thermal power and its fundamentals. Concentration of solar radiation. Solar troughs, Fresnel concentrators, solar dish concentrator.

PYU44PP2 Physics Research Project

Semester 1, Semester 2 – 20 credits

(Co-ordinator P. Eastham)

This module comprises a 9-week full-time research project in Physics or in Astrophysics, conducted in a research laboratory in the School, CRANN or elsewhere. Students also attend School seminars (8 seminars).

Learning Outcomes

On successful completion of this module, students should be able to:

- Carry out an open-ended research project through all of its stages: literature study, data collection and data analysis
- Generate a concise research report
- Summarize in poster format the outcomes of a research project
- Make an oral presentation to an audience of peers

PYU44PP5 Problem Solving in Physics

Semester 1 – 5 credits (Co-ordinators C. McGuinness and I. Shvets)

9 tutorials. Techniques for using knowledge of physics to solve general problems will be developed.

Learning Outcomes

On successful completion of this module, students should be able to:

- Participate in group discussion of problem-solving in physics
- Perform calculations that integrate disparate elements of physics

Assessment

Examination in problem solving

Weighting

100%

Learning Outcomes

On successful completion of this module, students should be able to:

- Demonstrate knowledge of the foundations of solid state Physics in terms of non-interacting electrons
- Give a quantum mechanical description of the chemical bond for homonuclear and heteronuclear molecules
- Describe the determination of simple band structure using the tight-binding method
- Perform analytic calculations to solve elementary condensed-matter-related problems (simple molecule spectrum, band-structure of s-like 1D and 2D materials and of graphene)
- Formulate a model based on the concepts learnt to explain simple condensed matter phenomena (e.g. the Peierls distortion)
- Understand the difference between an interacting and a non-interacting problem and formulate a mean-field theory

Syllabus

Introduction: What Hamiltonian? Born-Oppenheimer Approximation; Tight-binding method for molecules; From molecules to solid; Going from 1D to 2D and 3D; C-graphite and C-nanotubes; Interfaces: charge transfer and screening; A proper calculation: the Coulomb potential back; Density Functional Theory; Kohn-Sham equations; The interacting problem; the Hubbard model for two sites and variable number of electrons; The mean field approximation.

Learning Outcomes

On successful completion of this module, students should be able to:

- Describe the concept of a photon, and relate this to the mathematical treatment of the quantum-mechanical electromagnetic field
- Use this knowledge to calculate basic physical properties of the quantum-mechanical electromagnetic field
- Describe the theory of the interaction of quantized fields with matter
- Use density matrix formalism of composite systems and generalised measurements
- Derive key concepts in bipartite entanglement theory
- Describe key concepts such as data compression and phase estimation
- Understand decoherence models for a single qubit

Syllabus

Planck distribution, shot noise, photon counting statistics, Poissonian, sub-Poissonian and super-Poissonian light, mode expansion of the field and cavities, quantization of the field, stimulated emission and lasing, operators for the electric and magnetic fields. Number states and their field distribution. Origin of vacuum fluctuations. Coherent states and their properties. The Jaynes-Cummings model, vacuum Rabi splitting, Rabi oscillations.

Overview of operational viewpoint of quantum mechanics (Bloch sphere, density matrices, composite systems), The Schmidt Decomposition, Purification, Operator Sum representation, Generalised measurements, Data Compression, Accessible Information, Entanglement measures, generalised entropies, quantum teleportation, quantum phase estimation and decoherence models for a single qubit.
